**Executive Summary** 

## **Executive Summary**

#### Introduction

In September 2014, AECOM was commissioned by Strathclyde Partnership for Transport (hereafter SPT) and East Dunbartonshire Council (EDC) to carry out a STAG Part 2 Transport Appraisal of sustainable transport options within the Kirkintilloch / Lenzie - Bishopbriggs-Glasgow corridor. This report follows on from the Pre-Appraisal STAG study undertaken by EDC in 2013 and the Part 1 Multi-Modal Appraisal carried out by AECOM in early-2014 (both under separate cover). This study aims to support delivery of the Council's Local Transport Strategy (LTS) 2013-2017 and emerging Local Plan 2. Building upon the previous work, this commission involves a detailed appraisal undertaken in line with the Scottish Transport Appraisal Guidance (STAG) to appraise a sifted list of interventions on the corridor.

#### The Study Area

East Dunbartonshire has a population of 105,900 people and trends suggest that the population is both ageing and declining. Located to the north of Glasgow, East Dunbartonshire is home to many commuter towns and villages supplying the city. Economic activity rates in East Dunbartonshire are above the Scottish average with 76% of the working population in employment. Just over 80% of households in the Council area have access to a car, ranking the Council among the top areas for car ownership in Scotland.

The study area under consideration as part of this commission primarily focuses on the larger settlements of Bishopbriggs, Kirkintilloch and Lenzie but also includes surrounding settlements. It considers trips made within its boundaries between settlements and trip attractors and trips made from the study area to trip attractors elsewhere such as Glasgow and Edinburgh.

#### **Key Problems**

The key problems currently facing the study area can be summarised as follows:

- Peak congestion, particularly on the A803 through Bishopbriggs, with associated impact on journey time reliability and air quality.
- High levels of through-traffic with a potential negative effect on local traffic movement.
- Parking pressures around rail stations (Lenzie), and on-street parking in Bishopbriggs including the A803.
- Bus journey time reliability on the A803 during peak times, and also on the M8 approach to Glasgow (express services from East Dunbartonshire via the A806).
- High demand for rail services from the study area, particularly on peak services between Lenzie / Bishopbriggs and Glasgow.
- Future growth in economic and housing developments including areas such as Woodilee and Westerhill which will potentially generate up to 3,000 extra trips during peak periods on the transport network.
- Relatively high private car ownership, with higher than national average use of car for travel to work and study.

Overall it can be said that congestion associated with high levels of car ownership and parking pressures at rail stations, expected to be exacerbated by future growth in demand as a result of key development areas, are the most prevalent issues in the study area. Whilst completion of the Bishopbriggs Relief Road (BRR) will alleviate traffic congestion in some areas, it may cause congestion on adjoining routes and if the scheme does not promote sustainable transport it may lead to an increase in emissions.

#### **Transport Planning Objectives**

Through consideration of the range of problems that affect transport in the study area, the aspirations of stakeholders, and both local and national policy, five planning objectives were considered suitable to be taken forward as part of the STAG appraisal, as follows:

- Promote modal shift to sustainable transport modes for trips to key attractors outside of the study area, particularly commuting journeys.
- Improve public transport journey times and journey time reliability through the study area.
- Improve accessibility by sustainable transport modes to key trip attractors within the study area.
- Deliver a transport network that supports improvements to human health and air quality, while minimising the impact on the environment.
- Provide a sustainable transport network that supports local development, regeneration and contributes to the sustainable economic growth of the study area.

#### **Project Options**

During STAG 1, a long-list of potential options was developed, appraised and sifted. The appraisal identified the following options as potentially suitable and feasible for further investigation at STAG 2:

- Option 1 Do Minimum.
- Option 2 A803 Quality Bus Corridor Package.
- Option 3 Bus Hub in Kirkintilloch.
- Option 4 Bus Park & Ride in the vicinity of the B757 / KLR.
- Option 5 Bus Park & Ride adjacent to BRR.
- Option 6 Kirkintilloch / Lenzie Loop Bus.
- Option 7 Increase parking Provision at Lenzie Rail Station.
- Option 8 Develop a New Rail Station at Woodilee (with Park & Ride).
- Option 9 Develop a New Rail Station at Westerhill (with Park & Ride).

#### **Option Development**

As required by STAG 2, work has been undertaken to provide further detail and definition to the options being taken forward for appraisal. This has largely related to the proposed new stations (Options 8 and 9) and has included additional rail timetabling work undertaken using AECOM's ARTEM train performance model which has indicated that whilst theoretically feasible, it should be noted that the rail industry may question the acceptability of additional stops on the Edinburgh – Glasgow rail network, in particular the associated impact on resilience. In addition, should one, or both, of the new stations be taken forward for further consideration, the proposed locations should be reviewed against the infrastructure requirements of the Edinburgh – Glasgow Improvement Programme (EGIP) Phase 2.

#### Consultation

Consultation has formed a key part of the STAG 2 process to gain feedback on each of the options being considered and an indication of public acceptability. The consultation has comprised three key strands:

- An appraisal workshop with key external stakeholders representing local communities and organisations covering active travel, bus, rail, health and economic development, including local businesses.
- Telephone interviews with stakeholders who were unable to participate in the workshops but expressed an interest in being involved.
- Key stakeholder engagement meetings, discussions and written communication, as appropriate, to allow the opportunity for key stakeholders to contribute to the appraisal process.

#### STAG 2 Appraisal

The nine Options have been assessed in terms of the Government's objectives: Environment, Safety, Integration, Economy, Integration, and Accessibility and Social Inclusion. Consideration has also been given to Cost, Deliverability and Public Acceptance.

#### Environmental Appraisal

There are a number of ways in which the environment can be affected through the implementation of the Options, and each has been assessed according to the impacts they might have on noise and vibration; air quality; water quality, drainage and flood defence; geology; biodiversity; landscape and visual amenity; agriculture and soils; and cultural heritage. A Strategic Environmental Assessment has also been undertaken and is available under separate cover.

In general terms it is considered that the Quality Bus measures (Option 2) and Kirkintilloch Loop Bus (Option 6) are unlikely to result in adverse environmental impacts as they involve minimal changes to existing infrastructure.

The other Options involve the construction of new infrastructure and will have associated adverse environmental impacts which may, in general terms, include permanent (operational) noise and vibration disturbance to receptors within the near vicinity of their location; pollutants and potential contaminants entering watercourses via surface water run-off during construction activities; impact upon visual amenity for local residents; impacts on agriculture should new infrastructure result in the loss or severance of agricultural land; soils impacted where excavation is required, and/or earthworks for site establishment; and cultural heritage potentially directly impacted from physical damage due to construction activities and / or vibration, or indirectly from impacts on their setting depending on the location, scale and design of the intervention. There is also the potential that there are unknown archaeological assets located at the proposed Park & Ride / new rail station locations.

A number of specific impacts have also been identified. Kirkintilloch town centre (proposed location of the Bus Hub, Option 3) is located within a Conservation Area and Townscape Protection Area. The Woodilee (KLR) site (Options 4 and 8) is within / immediately adjacent to the south Lenzie Conservation Area and Townscape Area and adjacent to a pocket of Ancient Woodland listed within the Ancient Woodland Inventory (AWI). This is also surrounded by residential areas and a long-distance pathway and Core Path along the Bothlin Burn. The B757 Park & Ride site (Option 4) is located within close proximity to the south Lenzie Conservation Area and Townscape Area and the Gadloch water body. At the Westerhill site adjacent to the BRR (Options 5 and 9), the railway line is identified as an important ecological corridor. Lenzie Rail Station is listed and is located within the south Lenzie Conservation Area and Townscape Area. It is surrounded by residential areas and the Lenzie Moss Local Nature Reserve (LNR) and Core Path, all of which may be adversely affected by expansion of the car park area (Option 7).

#### Safety Appraisal

#### **Accidents**

In terms of the number of Personal Injury Accidents and the change to the balance of severity of accidents associated with each Option, it is expected that Options which result in a smoother flow of traffic (through modal shift from private car) would see a reduction in link speeds which should in turn result in a reduction in the number and severity of accidents. It is anticipated that the Quality Bus measures (Option 2), and new rail stations at Woodilee / Westerhill (Options 8 and 9) would have a minor positive impact in this regard. All other Options are expected to have a neutral impact, with the exception of Option 7 whereby the increase in parking provision at Lenzie Rail Station may generate additional local traffic in populated areas, leading to possible safety concerns.

#### Security

The STAG 2 appraisal has considered that safety is of particular relevance in relation to the development of transport schemes. It is considered that the personal security concerns of many individuals when using public transport, walking and cycling can be largely dealt with in the provision of mitigating facilities designed into the scheme development, such that all Options would achieve a positive impact in this regard.

#### Economic Appraisal

Options have been assessed using Transport Scotland's Central Scotland Transport Model (CSTM12). Adopting a common modelling platform to assess the options provides consistent results enabling direct comparisons to be made. CSTM12 was considered to be the most fit for purpose tool available for the purposes of this study given the inclusion of the proposals for new rail stations at Woodilee (Option 8) and Westerhill (Option 9) and the need to assess the likely impacts of these options on the wider transport network across Central Scotland. However, there are a number of limitations associated with the model including that the scale of some of the options are relatively small in comparison to the overall modelled area. Nevertheless the results provide a reasonable indication of the relative attractiveness of the options. Should a preferred Option(s) be taken forward for further consideration, additional modelling will be required.

#### Transport Economic Efficiency

A key component of the STAG appraisal is the assessment of the Transport Economic Efficiency (TEE) of Options. The results for each of the Options are summarised below, in relation to the Do Minimum and Reference Cases respectively. The exception to this is Option 3 (Kirkintilloch Bus Hub) and Option 6 (Kirkintilloch/Lenzie Loop Bus) which cannot be assessed using CSTM12. The Reference Case considers the impact of a new Park & Ride rail station at Robroyston.

Criterion	Option							
(Values are in £000s)	2 – A803 QBC Package	4 – Bus Park & Ride in Vicinity of B757 / KLR	5 – Bus Park & Ride Adjacent to BRR <sup>1</sup>	7 – Increased Parking Provision at Lenzie Station	8 – New Rail Station at Woodilee (with Park & Ride) <sup>2</sup>	9 – New Rail Station at Westerhill (with Park & Ride) <sup>3</sup>		
PVB	£34,748	£30,593	£31,250	£8	£26,515	£35,320		
PVC	£1,024	£2,363	£2,363* / £10,084	£2,702	£8,810 / £6,339	£9,070 / £5,820		

#### Table A.1: TEE Summary for Options vs Do Minimum

<sup>&</sup>lt;sup>1</sup> Note, results provided for two sub-options which results in differing operating costs; operation of bus-based Park & Ride with services provided by existing bus services\* / operation of bus-based Park & Ride with services provided by new bus services.

<sup>&</sup>lt;sup>2</sup> Note, results provided for two sub-options; manned / unmanned stations.

<sup>&</sup>lt;sup>3</sup> Note, results provided for two sub-options; manned / unmanned stations.

NPV	£33,724	£28,230	£28,887* / £21,166	-£2,694	£17,705/£20,176	£26,250 / £29,518
BCR	33.9	12.9	13.2* / 3.1	0.003	3.0 / 4.2	3.9/6.1

Table A.2: TEE Summary for Options vs Reference Case

Criterion	Option								
(Values are in £000s)	2 – A803 QBC Package	4 – Bus Park & Ride in Vicinity of B757 / KLR	5 – Bus Park & Ride Adjacent to BRR <sup>4</sup>	7 – Increased Parking Provision at Lenzie Rail Station	8 – New Rail Station at Woodilee (with Park & Ride) <sup>5</sup>	9 – New Rail Station at Westerhill (with Park & Ride) <sup>6</sup>			
PVB	£35,293	-£10,003	-£8,718	£769	-£4,385	-£1,561			
PVC	£1,024	£2,363	£2,363* / £10,084	£2,702	£8,810 / £6,339	£9,070 / £5,802			
NPV	£34,269	-£12,366	-£11,081*/-£18,802	-£1,933	-£13,195 / -£10,724	-£10,631 / -£7,363			
BCR	34.5	-4.2	-3.7* / -0.9	0.3	-0.5 / -0.7	-0.2 / -0.3			

As a comparison, the results indicate that the bus-based Options (Options 2, 4 and 5) are expected to generate greater positive economic benefit cost ratio (BCR) than the rail-based Options, primarily as these Options are not as costly as the rail Options.

The inclusion of a new Park & Ride rail station at Robroyston, however, has a significant impact on the level of benefits generated by the bus- and rail-based Park & Ride schemes (Options 4, 5, 8 and 9). This is because previously generated benefits are abstracted by Robroyston station, as car users are attracted onto public transport at Robroyston. As a result, it is estimated that there would be fewer passengers using the proposed bus- and rail-based Park & Ride stations and any passengers of the new stations will be existing public transport users rather than people switching mode. This results in a significant public transport user dis-benefit for these Options and is the primary reason for the significant differences between the present value of benefits (PVB) for these Options when compared against the Do Minimum or Reference Case scenario.

The exception to the above is the A803 Quality Bus Corridor Package (Option 2) which does not appear to be impacted by the availability of a new Robroyston station and generates positive impacts in both the Do Minimum and Reference Case scenarios.

#### Economic and Locational Impacts

The STAG Economic and Locational Impact (EALI) analysis has considered impacts of each Option, including an expression of the levels of economic activity by type and location of business / land-use activity. Overall, it is considered that each of the Options may help to support local economic development opportunities through a contribution of managed congestion brought about by increased accessibility, and improved journey times particularly along the A803 corridor.

Option 2, through the implementation of Quality Bus measures, and Options 4 and 5 through the provision of bus-based Park & Ride facilities, may have wider economic impacts through improving public transport and accessibility to Glasgow. Options 5 and 9 specifically would also be expected support local development and economic growth in the study area by improving access by public transport to Westerhill Business Park. The implementation of a bus hub in Kirkintilloch (Option 3) may have a marginal impact on the economy of Kirkintilloch through reduced congestion and improved accessibility through the town centre attributable to the rationalisation of bus stops. Option 6 may have wider economic impacts through improving public transport

<sup>&</sup>lt;sup>4</sup> Note, results provided for two sub-options which results in differing operating costs; operation of bus-based Park & Ride with services provided by existing bus services\* / operation of bus-based Park & Ride with services provided by new bus services.

<sup>&</sup>lt;sup>5</sup> Note, results provided for two sub-options; manned / unmanned stations.

<sup>&</sup>lt;sup>6</sup> Note, results provided for two sub-options; manned / unmanned stations.

access between Lenzie and Kirkintilloch, however this may be negated if the implementation of a loop bus service opens up the local economy of Kirkintilloch to more competition through improving access to the rail network and associated wider economic centres. The increased parking provision associated with Option 7 may have wider economic benefits through improving public transport and accessibility to Glasgow and other economic centres served by the rail network. Options 8 and 9, through the implementation of new rail stations, are likely to have the greatest economic impact through improving public transport and accessibility to Glasgow, and other key economic centres located on the Edinburgh – Glasgow and Stirling / Alloa – Glasgow rail line.

A number of developments have been identified in the local area which could be influenced by the implementation of the Options. It is considered in qualitative terms that each of the Options will act as a fundamental 'building block' in the continuing competitiveness of East Dunbartonshire, and Glasgow, as strategic investment locations.

The Bus Hub (Option 3), Park & Ride in vicinity of B757 / KLR (Option 4) and Loop Bus (Option 6) may provide greater accessibility for the pocket of deprivation within Kirkintilloch (Hillhead), and there may be a small positive benefit to the area of deprivation within Lennoxtown afforded by Options 3 and 6.

#### Integration Appraisal

#### Transport Integration

It is considered that all of the Options, except Option 7, will have a positive impact on transport integration through improved integration between modes and a reduction in reliance on private car use. The Quality Bus measures (Option 2), Bus Hub (Option 3), Bus-Based Park & Ride (Options 4 and 5), and new rail stations (Options 8 and 9) would be designed with consideration given to quality of infrastructure, layout, information provision and ticketing arrangements, in addition to measures to assist accessibility for the elderly and mobility impaired.

Whilst the Options involving Park & Ride (Options 4, 5, 8 and 9) would encourage people to transfer from cars to bus services for journeys to and from Glasgow, this may be negated by an increase in more local car trips to the Park & Ride / new station facility and this would require to be considered appropriately at the design stage. Due cognisance would require to be given to Option 8 and 9 which impact on the wider rail network, specifically the EGIP proposals, to ensure effective integration.

The potential new loop bus service (Option 6) would link key locations and would be timetabled to dovetail with rail services at Lenzie Rail Station, thus significantly improving integration between bus and rail modes. This Option includes the potential for integrated bus-rail ticketing. Increased parking at Lenzie Station (Option 7) would encourage modal shift from car to rail thus improving the level of integration between the modes for longer journeys. However, this may be negated by an increase in more local car trips to the rail station.

#### Land-Use Transport Integration

In terms of overall land-use transport integration, the Quality Bus measures (Option 2) would have a minor positive impact through improved bus journey times and journey time reliability, and could provide improved access primarily for residents from Bishopbriggs commuting to / from Glasgow, and also potentially improve public transport access to the Strathkelvin Retail Park, Westerhill and the surplus Bishopbriggs Academy site (when developed). The Bus Hub (Option 3) is aimed at providing a more attractive bus system within Kirkintilloch, which is likely to attract public transport users to this mode and will support wider regeneration plans for the town.

The Park & Ride and new station Options (Options 4, 5, 8 and 9) are expected to have a positive impact through promoting modal shift for commuting journeys between the study area and Glasgow, and providing access to a variety of land uses in the wider area. It is expected that the Park & Ride facility in the vicinity of the B757 / KLR (Option 4) and the new rail station at Woodilee (Option 8) would integrate with residential properties located to the east of the Link Road (Woodilee), where public transport services are currently limited. It is also expected that the Park & Ride facility adjacent to the BRR (Option 5) and new station at Westerhill (Option 9) would integrate with existing and proposed residential developments in Bishopbriggs and also offer sustainable access to Westerhill Business Park.

The Kirkintilloch / Lenzie loop bus (Option 6) is expected to have a moderate positive impact through linking Lenzie Rail Station to a variety of land uses in the local area including shopping, housing, education, employment and transport; and increased Parking Provision at Lenzie Station (Option 7) is expected to enhance access to the rail network and thus also having a minor positive impact on land-use integration through improved access to land uses in the wider area.

Overall, it is considered that none of the land required for the proposals is reserved for uses which are incompatible for transport, and none of the proposals conflict with any other existing or planned development.

#### **Policy Integration**

The policy integration appraisal examines whether the proposed scheme contributed to, and is consistent with, other Government policies beyond transport.

All Options have been assessed in line with STAG's Policy Assessment Framework (PAF). In general terms, it is considered that all Options promote sustainability and reduce the need to travel to varying degrees through encouraging modal shift and assisting in achieving a healthy, prosperous and inclusive society, albeit the impact of this may be negated in relation to Option 7 if increased parking at Lenzie Rail Station results in additional traffic on local roads. All Options which involve the construction of new infrastructure will be designed to take due cognisance of the Equality Act 2010.

#### Accessibility and Social Inclusion Appraisal

#### Community Accessibility

*Public Transport Network Coverage* is measured by the changes in the number of people with public transport access to key services and destinations. It is considered that each of the Options would increase accessibility by public transport to varying degrees by realising key benefits for those who do not have access to a private car or choose not to travel by car for their whole journey due to factors such as cost and availability of parking at their destination, journey times, journey time unreliability etc.

For rail-based Options (Options 8 and 9) the number of people able to access local and city centre employment opportunities will increase, given the speed and capacity characteristics of rail versus other modes. This could lead to increased demand for rail. Options 8 and 9, through the construction of new rail stations, would increase public transport network coverage. The implementation of Quality Bus measures (Option 2) would improve bus journey times and journey time reliability for both local trips and also commuter trips to / from Glasgow via the A803, albeit there would be no increase in level of public transport coverage. The development of a bus hub in Kirkintilloch (Option 3) could assist in reducing town centre congestion through the centralisation of bus stop locations, and improve bus journey times and journey time reliability for local trips, albeit, again, there would be no increase in public transport coverage. The implementation of bus-based Park & Ride (Options 4 and 5) could increase the attractiveness of bus as a mode of transport for commuting trips to / from Glasgow and would potentially remove pressure from the rail network and assist in alleviating Lenzie Rail Station parking difficulties. The introduction of a Kirkintilloch / Lenzie loop bus service (Option 6) would increase public transport network coverage and improve access to Lenzie Rail Station, thereby increasing the number of people able to access local and city centre employment opportunities. Furthermore, the loop bus service would assist in improving access to employment opportunities within Kirkintilloch town centre, both for those who would make the journey entirely by bus and those who would interchange with rail services at Lenzie.

The Access to Local Services criterion considers walking and cycling access to local activity centres and public transport. It is considered that Options 2 and 3 may promote further non-motorised trips to access local services through the provision of quality bus measures and improved public transport provision. This, together with complementary measures to improve accessibility for pedestrians and cyclists, is expected to provide minor positive benefits. The bus improvements associated with the loop bus service (Option 6) will also be of benefit in improving access to local services, particularly within Kirkintilloch and providing linkages to Lenzie. This is particularly important in terms of tackling social exclusion and providing sustainable transport access to key services, facilities and employment for those without direct access to a rail station. In addition, Options 4, 5, 8 and 9 may promote non-motorised access to local services through the provision of Park & Ride / new station facilities.

There are no anticipated issues relating to severance for pedestrians or cyclists as a result of implementation of any of the proposed Options. The new Park & Ride facilities (Options 4, 5, 8 and 9) should include facilities for cycle provision and pedestrian links to the surrounding facilities. In addition, consideration to access routes for pedestrians and cyclists will form a key element in the implementation of all Options, and availability of cycle parking should be considered where appropriate.

Overall the impact on local accessibility is expected to be positive, with the exception of Option 7 whereby the net impact is likely to be neutral due to the impact of increased traffic levels on local roads negating any accessibility benefits to pedestrians and cyclists.

#### **Comparative Accessibility**

The distribution of accessibility impacts is relevant in that it identifies the extent to which the proposals benefit certain social groups (for example, car availability, gender, age, employment status, mobility impairment, income, trip purpose) or geographical locations (for example regeneration, deprivation or development areas, areas of poor public transport provision) most in need of access by public transport to essential activities.

In terms of *Distribution of Impacts by People Group* it is considered that Options 2, 4, 5, 8 and 9 would have a minor positive impact in terms of tackling the problem of private car use by encouraging a modal shift towards public transport and sustainable modes of travel and improving accessibility to the public transport network. Whilst this will enhance the level of accessibility for those without the use of a car, existing car users will also be encouraged to leave their cars at home in favour of other modes. In addition, households located within the small pockets of deprivation in Kirkintilloch would particularly benefit from improved access to services and employment opportunities afforded by the bus hub (Option 3) and loop bus (Option 6), and these Options are therefore expected to have a moderate positive impact in this regard.

Option 7, however, would be anticipated to bring a slight increase in access to rail services to those who own a car only; therefore, this Option is expected have an overall neutral impact.

In terms of *Distribution of Impacts by Location*, there is an overall positive gain in accessibility associated with each of the Options, primarily through encouraging modal shift and reducing overall reliance on the private car. It is further anticipated that all Options would have a positive impact on improving access to development and regeneration areas to varying degrees, with the exception of Option 7 which would bring a slight increase in access to rail services for those who own a car, but is unlikely to provide improved access to development and regeneration sites.

#### Deliverability and Public Acceptability

It is recognised that the preferred Option should deliver transport measures to address the issues relating to high car ownership and rising levels of traffic and congestion in the study area. Furthermore, it should be compatible with potential long-term development strategies within the study area. Construction and operational risks associated with the implementation of the preferred Option should be minimised.

It is considered that each of the Options could, theoretically, be delivered successfully. Specifically in relation to the bus-based Park & Ride Options (Options 4 and 5), future implementation of hard-shoulder running on the M80 (understood to be under consideration by Transport Scotland) could enhance the deliverability of these Options through providing improved journey times and journey time reliability during periods of high traffic volumes.

There are however, certain issues pertaining to deliverability that have been identified, including capacity constraints on the rail network to accommodate additional stops associated with the new rail station sites; impact of new rail station sites on EGIP Phase 2; resilience of the rail network in terms of impact and risk associated with additional stopping times should either, or indeed, both new stations be implemented; availability of funding and issues relating to the commercial viability and funding of the bus-based Options, in particular the Kirkintilloch loop bus (Option 6) and the new stations (Options 8 and 9); completion of the BRR; and land acquisition. In addition, the potential Park & Ride facility at Westerhill (Option 4) would perhaps be less effective should the proposed Park & Ride facilities at Robroyston and the M80 Hornshill Junction (under consideration by North Lanarkshire Council) be implemented in the future.

In general terms, public consultation has established that Options which will reduce congestion and improve journey time reliability along the A803 would be publically acceptable, together with Options which improve accessibility to key services and destinations. In the context of the bus hub (Option 3) it was generally considered that simpler measures such as improved shelters and facilities, real time information at bus stops and the general creation of a more pleasant waiting environment would add greater value. It was suggested that increased parking provision at Lenzie Station (Option 7) would attract more traffic into the area - this would not be publically acceptable. The potential reduction of recreational green space associated with extending Lenzie Station parking (Option 7) at the surface level was not supported, and there was strong opposition to the decking due to the impact on visual amenity. There was general support for the new rail stations (Options 8 and 9), albeit consideration would require to be given to potential deliverability and capacity constraints associated with implementing new stations on the Edinburgh – Glasgow rail line.

Consultations with EDC have established that all Options are consistent with local policies for the area, and the Kirkintilloch Masterplan team has indicated that the measures to create a bus hub associated with Option 3 would complement wider development proposals for the regeneration of Kirkintilloch town centre.

Transport Scotland and Glasgow City Council have queried the resilience of the rail network to accommodate new rail stations at Westerhill and Woodilee. In addition, SPT has queried the commercial viability of a loop bus service. Further work would be required to establish the feasibility and market demand for these Options, should they emerge as preferred Options.

#### Costs to Government

The estimated capital cost associated with each Option is displayed within Table A.3, below.

#### Table A.3: Capital Costs<sup>7</sup>

	Capital Cost (based on specified		Optimism Bias		
Option	assumptions and estimated uncertainty - / +30%)	uncertainty Rate Applied to estimating Applied to		Applied to base cost	Estimated Timescale for Implementation
	(£)	%	(£)	(£)	
Option 1 – Do Minimum		Comm	itted Funding		Ongoing
2 – A803 QBC Package *	630,000 - 1,170,000	44%	907,200 - 1,684,800	1,296,000	36 months
3 – Kirkintilloch Bus Hub	105,000 - 195,000	44%	151,200 - 280,800	216,000	12 months
4 – Park & Ride in Vicinity of B757 / KLR	616,000 - 1,144,000	44%	887,040 -1,647,360	1,267,200	12 months
5a – Park & Ride Adjacent to BRR (served by existing buses)	616,000 - 1,144,000	44%	887,040 - 1,647,360	1,267,200	12 months
5b – Park & Ride Adjacent to BRR (served by new services)	616,000 - 1,144,000	44%	887,040 - 1,647,360	1,267,200	12 months
6 – Loop Bus	7,000 – 13,000	44%	10,080 - 18,720	14,400	6 months
7a – Lenzie Station Parking (Surface	350,000 - 650,000	66%	581,000 - 1,079,000	830,000	2-3 years

<sup>7</sup> It should be noted that costs provided do not account for land acquisition, utilities or design. Costs associated with the provision of a bus-based Park and Ride facility assume a six to twelve-month construction period, with no protracted local planning issues.

Extension)						
7b – Lenzie Station Parking (Decking)	1,519,000 - 2,821,000	66%	2,521,540 - 4,682,860	3,602,200	3-5 years	
8a – Woodilee Rail Station (40-50 spaces)	3,199,000 - 5,941,000	66%	5,310,340 - 9,862,060	7,586,200	5+ years	
8b – Woodilee Rail Station (300+ spaces)	4,599,000 - 8,541,000	66%	7,634,340 - 14,178,060	10,906,200	5+ years	
9 – Westerhill Rail Station	2,870,000 - 5,330,000	66%	4,764,200 - 8,847,800	6,806,000	5+ years	
* There are multiple potential measures relating to the QBC package - the cost provided relates to a comprehensive and wide- ranging package of measures.						

#### Monitoring and Evaluation

The Scottish Government requires monitoring and evaluation to be undertaken and documented for any proposal for which it provides funding or approval. For the purposes of this study, it is anticipated that the Base Case will be developed and agreed with EDC, Transport Scotland, SPT, Network Rail and bus operators, as appropriate, during the period immediately prior to completion / operation of the preferred Option. It is not possible at this stage to be specific about the nature of the process evaluation. It seems likely that there will be a need to provide data which will measure changes in the baseline scenario such as various environmental parameters, public transport passenger counts, mode choice surveys and junction performance.

Before the monitoring programme is agreed upon, consideration must be given to the actual availability of the data, practicalities from collecting new data, its format, whether it will properly reflect the indicators proposed and the cost of obtaining it. Indicators and targets should be subject to regular reviews to ensure that they continue to properly reflect the performance of the project against its objectives, throughout the monitoring period.

#### **Risk and Uncertainty**

Consideration of risk and uncertainty is essential throughout project development. The identification, management and mitigation of risks will involve inputs from all appropriate stakeholders and it is recommended that Transport Scotland and SPT be involved in discussions, together with Network Rail and rail and bus operators, as appropriate.

It is recognised that the identification of risks and uncertainties will form an ongoing process. At this stage, risks have been identified in relation to land acquisition, and associated costs, in terms of the bus-based Park & Ride sites (Options 4 and 5) and the new rail station sites (Options 8 and 9); capacity constraints on the rail network and resilience of rail timetabling in relation to accommodating new rail station sites and additional stops (Options 8 and 9); availability of funding for the bus-based Options, in particular the Kirkintilloch loop bus (Option 6); and impact on identified environmental sites, particularly for the bus-based Park & Ride facilities (Options 4 and 5) and the new rail stations (Options 8 and 9), and also expansion of parking at Lenzie Station (Option 7). In addition, if roadspace priority is afforded to public transport it is possible that there may be adverse impacts on local traffic movements, particularly through already constrained networks, if Phases 4 and 5 of the BRR are not completed.

#### **Conclusions and Recommendations**

On the basis of the appraisal, the following recommendations are made:

Overall, the development of Quality Bus measures on the A803 (Option 2) performs strongly against the transport planning objectives of the study, the STAG criteria and is considered to be technically and operationally feasible. Unlike other options, the Quality Bus measures are estimated to deliver benefits under scenarios both with and without the implementation of a new station at Robroyston. By way of next steps, it is recommended that a detailed feasibility study is undertaken to examine the specific Quality Bus measures that could be implemented along the corridor phased with the development of the BRR. This will ensure that the benefits of the BRR are 'locked in' on the A803 and allow partners'

to put forward the case for investment in bus measures on the A803 as part of future work looking at enhancing bus quality corridors across the wider SPT area.

- The Kirkintilloch Bus Hub (Option 3) does not perform as strongly against the transport planning objectives of this study but does have the potential to deliver local benefits for public transport users in Kirkintilloch. It is therefore recommended that the findings from the review of the Bus Hub are taken on board as part of the future and ongoing masterplanning works for the regeneration of the town centre.
- Both bus-based Park & Ride options (Options 4 and 5) would positively address the transport planning objectives of this study. Option 5 in particular has the potential to deliver benefits not only for public transport users travelling into Glasgow, but also for commuters travelling into East Dunbartonshire owing to its vicinity to Westerhill Business Park. If these Options are taken forward, it would be recommended that more detailed site specific investigation is undertaken into potential locations for Park & Ride facilities at both locations. For both Options, and in particular the Westerhill Option (Option 5) which could require the development of a new service or diversion of existing services, it is to be noted that there would be a need for a minimum level of patronage in order for Park & Ride operations to be sustainable and this would require further examination. These Options should also be kept under review pending potential developments in the form of potential new Park & Ride facilities on the M80 Hornshill junction and the Robroyston Park & Ride station, both of which have the potential to impact on the feasibility of the East Dunbartonshire proposals.
- The Kirkintilloch/Lenzie loop bus (Option 6) performs positively against the transport planning objectives, specifically as it promotes integration and would improve accessibility between a number of key locations within the study area, and should encourage interchange opportunities with Lenzie Rail Station, which could relieve parking pressures at the Station. However, there are serious question marks over the commercial viability of this service and it is therefore recommended that this Option is not advanced at this stage. As an alternative, community and demand responsive transport can play an important role in improving local accessibility and in the absence of a commercially viable service may be more appropriate to promote for local passengers.
- Given the public concerns and potential environmental impacts around increasing car parking provision at Lenzie Rail Station (Option 7), it would be recommended that this Option is not considered further and instead opportunities are examined to improve and promote local access to the Station by sustainable transport means (i.e. walking and cycling) as an alternative approach to relieving parking pressures.
- Both rail-based Park & Ride Options (Options 8 and 9) perform strongly against the transport planning objectives of this study and the rail operational review undertaken as part of this study has suggested that both are theoretically feasible. However, significant concerns have been raised about the deliverability and acceptability of additional stops on the Edinburgh–Glasgow rail network in terms of the impact of reduced resilience on the line which would likely face opposition in the context of EGIP. In addition, whilst both Options would improve accessibility to the Woodilee and Westerhill areas, the transport modelling exercise undertaken has suggested that benefits of the new stations would be abstracted with a new Robroyston Station in place; a proposal which has been advanced considerably further in rail planning terms. If there remains an aspiration to take forward these Options, it would be recommended that more detailed operational modelling is undertaken to investigate the impacts of the schemes on the wider resilience of the rail network. It would also be recommended that should either (or, indeed both) of the new stations be taken forward, the proposed locations should be reviewed against the infrastructure requirements of EGIP Phase 2.
- Finally, a number of wider schemes outlined within the Council's LTS, and proposed by partner organisations, have the potential to contribute to the delivery of the study's objectives and improve local travel choice and conditions throughout the study area. Whilst the Options appraised at STAG 2 have focused on infrastructure-based measures, to be a success and deliver the transport planning objectives of this study, including modal shift, these need to be complemented by local access improvements such as walking and cycling facilities, and wider publicity and awareness campaigns. Wider schemes being considered at the regional level around integrated ticketing and passenger information should also continue to be supported given the contribution these can make in delivering a step-change in public transport use.

# 1 Introduction

#### 2

### 1 Introduction

#### 1.1 Background

In September 2014, AECOM was commissioned by Strathclyde Partnership for Transport (hereafter SPT) and East Dunbartonshire Council (EDC) to carry out a STAG Part 2 Transport Appraisal of sustainable transport options within the Kirkintilloch / Lenzie - Bishopbriggs-Glasgow corridor.

This report follows on from the Pre-Appraisal STAG study undertaken by East Dunbartonshire Council in 2013 and the Part 1 Multi-Modal Appraisal carried out by AECOM in early-2014. This study will support delivery of the Council's Local Transport Strategy (LTS) 2013-2017 and emerging Local Plan 2. Building upon the previous work, this commission involves a detailed appraisal undertaken in line with the Scottish Transport Appraisal Guidance (STAG) to appraise a sifted list of interventions on the corridor.

#### 1.2 STAG Appraisal

STAG is the official appraisal framework developed by the Scottish Government to aid transport planners and decision-makers in the development of transport policies, plans, programmes and projects in Scotland. It is a requirement that all transport projects for which Scottish Government support or approval is required, are appraised in accordance with STAG.

STAG has three parts:

- Pre-Appraisal: an analysis of present and future problems, constraints and opportunities; project objectives are established with key stakeholders; and option generation sifting and development;
- Part 1 report: initial appraisal and broad assessment of impacts, designed to decide whether a proposal should proceed, subject to meeting the planning objectives and fitting with relevant policies; and
- Part 2 report: detailed appraisal of the options taken forward from the Part 1 appraisal with specific consideration to the Government's objectives (Environment, Safety, Economy, Integration, Accessibility and Social Inclusion), cost to government, monitoring and evaluation, and risk and uncertainty.

Appraisal Summary Tables (ASTs) are used to present summaries of the appraisals: AST1 tables are used for Part 1 appraisals, and AST2 tables for Part 2 appraisals. In addition, Option Summary Tables (OSTs) are used to summarise each of the options which have passed through the full STAG process.

The transport modelling approach taken to the appraisal has been conducted through the use of the Central Scotland Traffic Model (CSTM12). In addition, rail operational feasibility has been appraised using AECOM's ARTEM train performance model.

Initial stages of problem identification and quantification were undertaken through reviews of national and local policy, analysis of Census and other statistical information, and consultation with stakeholders. This was further supplemented with interrogation of the CSTM12 model. Planning objectives were developed from the review of problems and opportunities, and in consultation with stakeholders.

An initial long list of possible measures for improving the transport situation in the study area (across all modes of transport) was developed. Each measure was subsequently appraised at STAG Part 1 level.

This process was then followed by the STAG Part 2 appraisal of options.

#### 1.3 Structure of Report

This report provides an overview of the findings from the STAG Part 1 appraisal, and details the option development which has subsequently been undertaken. This report also details the approach to the STAG 2, and the STAG Part 2 appraisal itself, in line with the five STAG criteria of Economy, Safety, Environment, Integration, and Accessibility and Social Inclusion. Consideration is also given to consultation, monitoring and evaluation, and risk and uncertainty issues. This is set out within the following Chapters:

- Chapter 2 Overview of STAG Part 1 Appraisal;
- Chapter 3 Option Development;
- Chapter 4 STAG Part 2 Consultation;
- Chapter 5 STAG Part 2 Appraisal;
- Chapter 6 Monitoring and Evaluation;
- Chapter 7 Risk and Uncertainty; and
- Chapter 8 Conclusions.

In addition, this report contains nine Appendices, as follows:

- Appendix A Problems vs. Objectives Matrix;
- Appendix B Option Appraisal Assumptions;
- Appendix C Rail Feasibility Review of Rail Station Sites;
- Appendix D Rail Operational Review of Rail Station Sites;
- Appendix E Workshop Outcomes Handbook;
- Appendix F AST2s;
- Appendix G Equality Impact Assessment;
- Appendix H Policy Appraisal Framework;
- Appendix I Accessibility Mapping.

2 Overview of STAG Part 1 Appraisal

#### 5

# 2 Overview of STAG Part 1 Appraisal

#### 2.1 Introduction

This Chapter will provide an overview of the STAG Part 1 appraisal. The full STAG Part 1 appraisal is documented under separate cover (Part 1 Transport Appraisal, AECOM, April 2014).

#### 2.2 Study Area

East Dunbartonshire covers approximately 17,000 hectares. The authority has a population of 105,900 people and trends suggest that the population is both ageing and declining. Located to the north of Glasgow, East Dunbartonshire is home to many commuter towns and villages supplying the city. Economic activity rates in East Dunbartonshire are above the Scottish average with 76% of the working population in employment<sup>8</sup>. Just over 80% of households in the Council area have access to a car, ranking the Council among the top areas for car ownership in Scotland<sup>9</sup>.

The study area under consideration as part of this commission is shown in Figure 2.1 (highlighted in red)<sup>10</sup>. The study area primarily focuses on the larger settlements of Bishopbriggs, Kirkintilloch and Lenzie but also includes surrounding settlements, such as Torrance, Twechar, Lennoxtown and Milton of Campsie.

The study area therefore considers trips made within its boundaries between settlements and trip attractors, and trips made from the study area to trip attractors elsewhere such as Glasgow and Edinburgh.

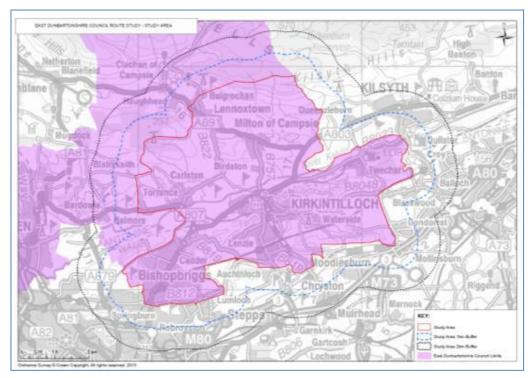

Figure 2.1 – The Study Area

<sup>&</sup>lt;sup>8</sup> <u>http://www.nomisweb.co.uk/reports/lmp/la/1946157413/report.aspx</u>

<sup>9</sup> http://www.scotlandscensus.gov.uk/ods-web/area.html

<sup>&</sup>lt;sup>10</sup> Buffer zones are shown for illustrative purposes only

#### 2.3 Key Problems

The key problems currently facing the study area can be summarised as follows:

- Peak congestion, particularly on the A803 through Bishopbriggs, with associated impact on journey time reliability and air quality.
- High levels of through-traffic with a potential negative effect on local traffic movement.
- Parking pressures around rail stations (for example Lenzie) and on-street parking in Bishopbriggs including on the A803. (However, the latter may be controlled further through the Council's Parking Action Plan and forthcoming decriminalised parking regime).
- Bus journey time reliability on the A803 during peak times, and also on the M8 approach to Glasgow (express services from East Dunbartonshire via the A806).
- High demand for rail services from the study area, particularly on peak services between Lenzie / Bishopbriggs and Glasgow.
- Future growth in economic and housing developments including areas such as Woodilee and Westerhill which will potentially generate up to 3,000 extra trips during peak periods on the transport network.
- Relatively high private car ownership, with higher than national average use of car for travel to work and study.
- Low uptake of walking and cycling for key journeys in some areas. Most on-road cycling is not segregated from normal vehicular traffic.

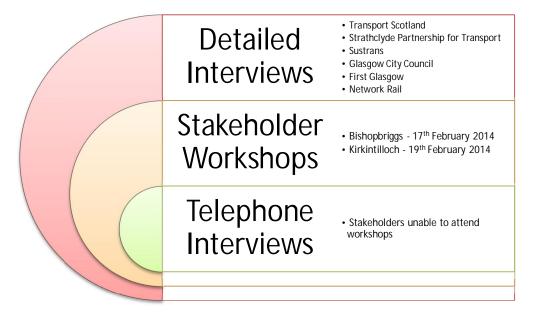

Overall it can be said that congestion associated with high levels of car ownership and parking pressures at rail stations, expected to be exacerbated by future growth in demand as a result of key development areas, are the most prevalent issues in the study area. Whilst the Bishopbriggs Relief Road completion will alleviate traffic congestion in some areas, it may cause congestion on adjoining routes and if the scheme does not promote sustainable transport it may lead to an increase in emissions. Further information on the identified problems and opportunities that this study seeks to address is presented in the Pre-Appraisal and STAG Part 1 Reports, although a summary is presented in Appendix A.

#### 2.4 Consultation

The consultation process undertaken as part of STAG Part 1 comprised the following methods:

- Detailed interviews with key stakeholders, namely Transport Scotland, SPT, Sustrans, Glasgow City Council, First Glasgow and Network Rail;
- Transport Appraisal Workshops (in Bishopbriggs and Kirkintilloch on 17 February and 19 February 2014) with invited stakeholders representing local communities and organisations covering active travel, bus, rail, health, tourism and economic development, including local businesses; and
- Telephone interviews with stakeholders who were unable to participate in the workshops but expressed an interest in being involved.

This is illustrated in the diagram below:

The results from these consultations informed the following aspects of the STAG Part 1 appraisal:

- Discussion of problems and opportunities affecting the study area;
- Confirmation of the objectives developed for the study; and
- Identification and appraisal of the different transport interventions proposed for the corridor.

In particular, the consultation outcomes were reflected in revised transport planning objective (TPOs), option development, and assessment of the deliverability of options.

#### 2.5 Issues, Constraints, Uncertainties and Opportunities

Key issues affecting the study area can be summarised as follows:

- Private car ownership in East Dunbartonshire is higher than national average.
- Use of car for travel to work and study is higher than the Scottish average (Census 2011).
- A large number of residents work or study out with the Council area, particularly in Glasgow (c.50%).
- Growing demand in the future from key development areas such as Woodilee and Westerhill.
- Anecdotal evidence that residents in East Dunbartonshire may drive to rail stations in neighbouring areas with greater car parking opportunities (for example Croy, Milngavie).
- General retraction in the commercial bus market (national trend due to rising fuel costs, less subsidy etc.) some communities are left without bus services (although SPT monitor and provide services where deemed necessary).

Key constraints and uncertainties relating to the study area can be summarised as follows:

- Parking capacity in and around Lenzie rail station is insufficient and there is no dedicated car parking at Bishopbriggs rail station.
- Capacity on peak rail services between Bishopbriggs and Glasgow and Lenzie and Glasgow, where there is evidence of overcrowding on services.<sup>11</sup>
- Carriageway space is limited in some parts of the A803 therefore most on-road cycling is not segregated from normal vehicular traffic.
- Lack of connectivity / interchange between local bus services and rail.
- There are various environmental constraints in the area including an Air Quality Management Area (AQMA), Conservation Areas, Heritage Sites (Antonine Wall) and important wildlife corridors.
- Transport Scotland's Edinburgh-Glasgow Improvement Programme (EGIP) has a target journey time on the Edinburgh-Glasgow rail line, which limits the prospects for additional stops for existing services (unless existing stops are dropped).
- The presence of Park & Ride facilities at rail stations within the vicinity of the study area could be viewed as both an
  opportunity and a constraint. For example, it has been reported that residents in the study area will drive to Croy to
  access rail services, and even Milngavie. Future proposals for Park & Ride, and potentially a new rail station at
  Robroyston would also abstract rail and bus patronage from the study area.
- Availability of road space to create further bus priority and space for cyclists, without having a significant impact on general traffic.
- Environmental impacts of additional car parking related to existing rail stations.
- With respect to bus-based public transport, East Dunbartonshire Council can only seek to influence the provision of
  commercially operated public transport provision, although they do have powers to provide subsidised public transport
  provision for services which are not commercially viable.
- As with buses, East Dunbartonshire Council have no direct powers over rail services, but can seek to influence facilities
   and provision.
- Capital and revenue funding will be dependent upon funding from East Dunbartonshire Council, SPT and the Scottish Government.

The most significant uncertainties affecting the proposal are those which will physically or materially impact upon the strategy options. At present the key uncertainties appear to be:

- Land ownership some options may require development of land that may not be owned by East Dunbartonshire Council.
- Public and stakeholder acceptability issues for some of the options, and approvals required for new rail stations in particular.
- Impact of additional rail stops in the context of EGIP and timetabling on rail services from Stirling/Alloa and Edinburgh.

<sup>&</sup>lt;sup>11</sup> In addition, the Network Rail Scotland Route Utilisation Strategy Generation 2 (June 2011) states that "the morning peak arrivals at major centres can often experience load factors in excess of 100 per cent as they serve both interurban and local commuter markets. This occurs on the approach to both Glasgow and Edinburgh." It should also be noted that data from the model development report for CSTM, which derives rail demand based on amongst others travel diary and ticketing data, lists Stirling in to GQS as one of most congested parts of the network.

• Availability of funding for larger interventions.

There are a number of opportunities however which can support improving sustainable travel choices in the study area. These include:

- Building on the legacy of the Healthy Habits campaign in Kirkintilloch, and potentially extending the concept to other settlements.
- Linking to regeneration and masterplanning proposals for Kirkintilloch, and potential improvements to the Canal towpath by Scottish Canals.
- A new franchisee for the Scottish rail network, and any changes to services and infrastructure this may bring. The Scottish Stations Fund may also facilitate improvements to rail stations.
- Across the study area, there is an opportunity to work with partners to secure improvements to sustainable transport services and infrastructure.

#### 2.6 Transport Planning Objectives

Through consideration of the range of problems, issues, opportunities and constraints that affect transport in the study area, the aspirations of stakeholders, and both local and national policy, five key planning objectives were considered suitable to be taken forward to the STAG appraisal. These are as follows:

- Promote modal shift to sustainable transport modes for trips to key attractors outside of the study area, particularly commuting journeys.
- Improve public transport journey times and journey time reliability through the study area.
- Improve accessibility by sustainable transport modes to key trip attractors within the study area.
- Deliver a transport network that supports improvements to human health and air quality, while minimising the impact on the environment.
- Provide a sustainable transport network that supports local development, regeneration and contributes to the sustainable economic growth of the study area.

Following subsequent discussions with Transport Scotland, the transport planning objectives developed for the STAG Part 1 have been further "SMARTened", to include specific targets. Details can be found within Chapter 5.

#### 2.7 Options

Fifteen individual options were generated for inclusion in the STAG Part 1 appraisal. In addition, the 'Do Minimum' was carried forward for further appraisal in order to provide a reference case. The selected options are set out within Table 2.1, below.

Table 2.1: Options Appraised At STAG 1

Option Ref.	Option Name	Option Description
1.	Bishopbriggs Sustainability Package	Combines options relating to: Wayfinding signage and route designation for pedestrians in town centres particularly; Enhancing the quality, safety and routing of paths and footways to town centres, key trip generators, key bus routes and railway stations; Better cycle parking facilities at central / trip attracting sites; Priority parking for low-emission emitting / high occupancy vehicles at transport stations and town centres.
2.	Sustainable Transport in Kirkintilloch/Lenzie	Combines options relating to: Wayfinding signage and route designation for pedestrians in town centres particularly; Enhancing the quality, safety and routing of paths and footways to town centres, key trip generators, key bus routes and railway stations; Better cycle parking facilities at central / trip attracting sites; Priority parking for low-emission emitting / high occupancy vehicles at transport stations and town centres; Footways on the Kirkintilloch Link Road.
3.	Strategic Active Travel Corridors	Creation of a cycle corridor for longer distance cycling trips to Glasgow in particular and other areas of major employment. Potentially on-road A803 or off-road – to be defined.
4.	Introduce Cycle Hire Facilities	Cycle hire scheme, potentially in combination with measures to promote the visitor economy at Kirkintilloch in particular.
5.	A803 Quality Bus Corridor Package	Quality bus corridor in partnership with operators and SPT on the A803, to provide dedicated space and measures to improve bus journey times and journey time reliability for all bus movements on this corridor. Includes measures to improve bottlenecks to support bus flow in particular. Option also includes options identified from the Pre Appraisal stage including: Introduction of low-emission vehicles; Implementation of real-time bus information; Better marketing of public transport on key routes, perhaps using variable message signs (VMS). Delivery mechanism likely to be via a sQP in order to secure enhancements to bus services where appropriate. This option could be the precursor to Bus Rapid Transit (as per Fastlink) on this corridor in the future, subject to demand levels.
6.	Bus Hub in Kirkintilloch and associated Measures	Bus hub in Kirkintilloch and associated measures. Scale of intervention to be further defined – higher cost option would involve potential landtake to bring bus stops closer together into an interchange area in the town centre, whilst lower cost measures could include bus priority, pedestrian and cycling access improvements, more public transport information, ticket purchasing equipment, improved shelters. Includes Pre-Appraisal option of repositioning bus stops in Kirkintilloch.
7.	Bus Park & Ride adjacent to KLR and associated Bus	Bus Park & Ride adjacent to the KLR (location to be defined) or the B757 and associated bus priority measures to support access and egress by buses to

Option Ref.	Option Name	Option Description
	Priority	and from the local and strategic road network.
8.	Bus Park & Ride adjacent to BRR and associated Bus Priority	Bus Park & Ride adjacent to the BRR (location to be defined) and associated bus priority measures to support access and egress by buses to and from the local and strategic road network.
9.	Bus Service Improvements and New Services (including Kirkintilloch / Lenzie Loop Bus)	A potential new loop bus service linking key locations such as Lenzie Railway Station, Kirkintilloch Town Centre, Woodilee, residential areas and the Council main offices. Other service improvements / new services linked to new development areas in particular, to be defined.
10.	Public Transport Integration and Promotion Package	Combines options relating to: Wayfinding signage and route designation for pedestrians to / from rail and bus stations; Enhancing the quality, safety and routing of paths and footways to town centres, key trip generators, key bus routes and railway stations; Better cycle parking facilities at central / trip attracting sites; Improving bus passenger information and shelters; Improving integration between bus and rail services; Better marketing of public transport on key routes.
11.	Increase Parking Provision at Bishopbriggs Rail Station	Increase parking provision at Bishopbriggs Rail Station – location to be defined.
12.	Increase Parking Provision at Lenzie Rail Station	Increase parking provision at Lenzie Rail Station. Two sub-options exist; one based on extending the surface car park to the north and the other involving the creation of a new deck over the existing car parks/railway line.
13.	Develop a New Rail Station at Woodilee (with Park & Ride)	Develop a new rail station at Woodilee with Park & Ride.
14.	Develop a New Rail Station at Westerhill (with Park & Ride)	Develop a new rail station at Westerhill with Park & Ride.
15.	Encourage and / or develop a Car Club	Encourage and / or develop a car club by securing dedicated car club parking spaces and potentially using the services of an existing car club in neighbouring areas. Potential to link to Council buildings for employee use. Potential to secure developer contributions to fund cost of spaces linked to new developments.

It should be noted that all options have equal importance and that there are no options which are considered to be of a higher priority than others.

#### 2.8 Performance Against Planning Objectives, Government Objectives and Implementability

The initial assessment of the options against the planning objectives and the Government's objectives is detailed in the STAG Part 1 report, AECOM, April 2014. Also detailed in this STAG Part 1 report is the implementability assessment concerning technical feasibility, operational feasibility, financial feasibility and public acceptability.

#### 2.9 Outcome of Appraisal

The appraisal found that the following options are potentially suitable and are considered to be feasible for further investigation:

- A803 Quality Bus Corridor Package.
- Bus Hub in Kirkintilloch.
- Bus Park & Ride in the vicinity of B757 / KLR.
- Bus Park & Ride adjacent to BRR.
- Kirkintilloch / Lenzie Loop Bus.
- Increase parking Provision at Lenzie Rail Station.
- Develop a New Rail Station at Woodilee (with Park & Ride) and Promote Sustainable Access.
- Develop a New Rail Station at Westerhill (with Park & Ride) and Promote Sustainable Access.

#### 2.10 Summary

This Chapter has provided a brief overview of the STAG Part 1 appraisal, including the key problems pertaining to the study area. This has also included:

- Constraints, uncertainties, issues and opportunities;
- An overview of the consultation process;
- An outline of the planning objectives;
- Options developed; and
- An outline of those options and scenarios which were recommended for further consideration during the option development process.

Full details of the STAG Part 1 appraisal can be found in the STAG Part 1 report, AECOM, April 2014.

The following Chapter considers the option development subsequent to the STAG Part 1 appraisal.

AECOM East Dunbartonshire Part 2 Transport Appraisal – Kirkintilloch/Lenzie-Bishopbriggs-Glasgow Corridor Study Transportation

# 3 Option Development

## 3 Option Development

#### 3.1 Introduction

This Chapter describes the additional technical work which has been undertaken following the STAG Part 1 process, to "flesh out" the recommended Options in more detail. It describes the additional rail timetabling work undertaken using AECOM's ARTEM train performance model.

By their nature, a number of the options emerging from the pre-appraisal for assessment and packaging as part of the STAG Part 1 were defined at a relatively high level. In order to facilitate more detailed appraisal, as required under the STAG Part 2, work has been undertaken to provide further detail and definition to the options being taken forward for appraisal. This work is presented in Table 3.1 on the following page.

Table 3.1: STAG 2 Option Overview

Option	What is it?	Rationale for taking forward to STAG 2	Who is it aimed at / Who would use it?	Why would people change to this mode?	How competitive is it with other modes/options?	Anticipated benefits: Users and Non-Users	Indie
1 - Do Minimum	<ul> <li>Assumed interventions included as part of the Do Minimum for this project include:</li> <li>BRR (up to and including phase 5);</li> <li>SCOOT;</li> <li>Kirkintilloch Town Centre Regeneration;</li> <li>Parking Strategy and Decriminalised Parking Enforcement;</li> <li>EGIP Phase 1; and</li> <li>Glasgow City Council City Centre Strategy.</li> </ul>	This option considers the impacts on the local transport network if no improvements are made other than those set out within the definition of the Do Minimum.					
2 - A803 Quality Bus Corridor Package	Quality Bus Corridor in partnership with operators and EDC/SPT on the A803 between Torrance Roundabout and Colston Road, to provide measures to improve bus journey times and journey time reliability for all bus movements on this corridor.         Traffic Engineering measures could include: <ul> <li>Congestion by-pass lanes;</li> <li>Discontinuous bus lanes;</li> <li>Parking restrictions at peak periods;</li> <li>Infill bus stop lay-bys;</li> <li>Alteration to traffic turning movements and lane priority; and</li> <li>Priority through SCOOT controlled signalised junctions.</li> </ul> <li>Other options to enhance bus transportation could include:         <ul> <li>Implementation of real-time bus information.</li> </ul> </li> <li>The development of a QBC along the A803 could act as a precursor to a Bus Rapid Transit (as per <i>Fastlink</i>) subject to demand on this corridor.</li> <li>The range of proposed options would be enhanced with a fully implemented BRR.</li>	Without the full implementation of the BRR this option may have a negative effect on general road traffic, however it will enhance bus journey times and reliability. This option is likely to address current traffic issues and alleviate bus- based congestion along the A803 if the BRR is delivered.	Residents from Bishopbriggs (including proposed developments such as Bishopbriggs East) commuting into/from Glasgow. Residents from surrounding towns (i.e. Torrance) commuting into/from Glasgow.	The option would aim to deliver reduced bus journey times and improved bus journey time reliability between Bishopbriggs and Glasgow, addressing bus-based congestion issues and pinch-points currently experienced during peak periods.	<ul> <li>Option designed to provide comparatively better journey times than private car along the A803.</li> <li>Difficult to compete with the train for commuting to/from Glasgow (current train journey times between Bishopbriggs and Queen street are approximately 8 minutes).</li> </ul>	<ul> <li>Users: Shorter and more reliable bus journey times along the A803<sup>12</sup>.</li> <li><i>Non-Users</i>: a) This option may remove private cars from the A803, alleviating congestion problems and benefiting all road users.</li> <li>b) Modal shift from rail to bus would release capacity for rail services (where there is anecdotally overcrowding at present).</li> </ul>	

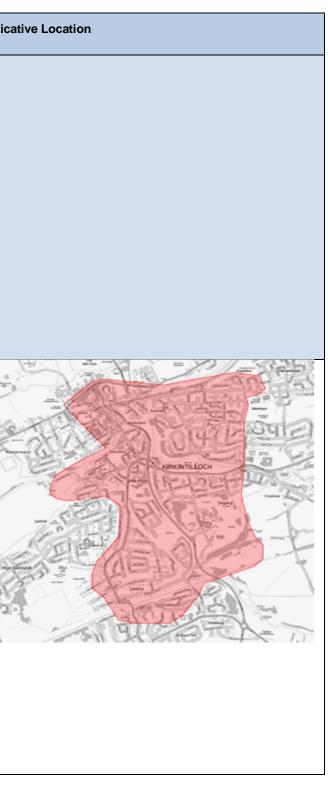

<sup>&</sup>lt;sup>12</sup> Previous studies ("*Proposed A803 Quality Bus Corridor and Bishopbriggs Relief Road – STAG Part 1 Appraisal" – Jacobs (March 2007)*) have suggested that delivery of a QBC is more attractive following full completion of the BRR as a means of locking in the benefits of the additional road capacity provided by the route.

Option	What is it?	Rationale for taking forward to STAG 2	Who is it aimed at / Who would use it?	Why would people change to this mode?	How competitive is it with other modes/options?	Anticipated benefits: Users and Non-Users	Indica
3 - Bus Hub in Kirkintilloch	Bus hub in Kirkintilloch and associated measures. Bring bus stops closer together into an interchange area in the town centre, supplemented by lower cost measures such as pedestrian and cycling access improvements, more public transport information and improved shelters. The option may require land take. It includes the Pre- Appraisal option of repositioning bus stops in Kirkintilloch.	It has been identified through consultation that the current positioning of bus stops in Kirkintilloch Town Centre could be contributing to congestion. This option would seek to address this problem and deliver improved information for passengers.	In principle, this is mainly a local measure directed at residents in Kirkintilloch and potentially Lenzie (possibly also surrounding towns such as Milton of Campsie and Lennoxton).	The option is aimed at providing a more attractive bus system (more information, improved infrastructure) within Kirkintilloch, which is likely to attract public transport users to this mode.	Local measure which is aimed at serving public transport users in Kirkintilloch, not at competing with other modes/options.	<ul> <li>Users: improved access to bus services (interchange area concept) and better overall bus standards.</li> <li>Non-Users: benefits to road users if a degree of modal shift is achieved and road capacity is released (reducing congestion issues through Townhead/Cowgate).</li> </ul>	L'ENT L'ENT
4 - Bus Park & Ride in the vicinity of B757 / KLR	Bus Park & Ride in vicinity of KLR or the B757 (location to be defined). It is anticipated that the facility would accommodate existing express services which link Kirkintilloch and Lenzie with Glasgow via the M80 and M8. The facility could be designed similarly to the Hampden Park & Ride in Glasgow. Such a layout is preferable to the main bus operator in the area. The frequency of bus services would be dictated by commercial viability. For the purposes of the appraisal it is assumed that the facility would be served by existing buses and no new buses would be required (although locating the Park & Ride facility adjacent to the KLR would require the diverting of some services that use the B757): an approximate 15-minute service is assumed during the peak period.	A bus-based Park & Ride facility located along the B757 (existing bus route) or KLR aimed at promoting a modal shift for commuting journeys between the study area and Glasgow would be expected to encourage modal shift from car to bus for journeys leaving the study area. A convenient bus-based Park & Ride facility could help to reduce parking issues at Lenzie Rail Station by encouraging access and patronage from rail to bus.	Mainly residents from Kirkintilloch/Lenzie commuting into/from Glasgow; possibly residents from communities to the north (Milton of Campsie and Lennoxton).	This option would provide a facility where people could park their private car and transfer to bus to commute into Glasgow. One of the issues associated with other modes (i.e. rail) is the lack of parking spaces at stations. Therefore, it is expected that this intervention could achieve a degree of modal shift. As the Park & Ride site would be serviced by existing buses making one additional stop, the impact on existing bus journey times is expected to be minimal.	In terms of travel times, existing services suggest that bus is comparatively slower than rail. Typical rail journey times are 13-14mins while bus times are around 21 mins. However, rail is more expensive than bus: a peak rail return ticket is £4.90 versus the bus where a day ticket is £4.10. Furthermore, the provision of car parking spaces may make bus more attractive.	<ul> <li>Users: better access to bus services by provision of parking spaces.</li> <li>Non-Users: modal shift (if achieved) would release road and rail capacity.</li> </ul>	
5 - Bus Park & Ride adjacent to BRR	Bus Park & Ride adjacent to BRR (location to be defined). It is anticipated that the facility would accommodate extension to existing services which link the Auchinairn, Woodhill and Westerhill areas of Bishopbriggs with Glasgow via local roads onto the A803. Extension of existing services would require further discussion with bus operators and it should be noted that First Glasgow indicated during the consultation process that extension of existing services would not be attractive. This option would also benefit from a service which directly serves the site from Glasgow, via the BRR, M80 and M8. The facility could be designed similarly to the Hampden Park & Ride in Glasgow. Such a layout is preferable to	This intervention is generally aimed at journeys leaving the study area and is expected to perform strongly against objectives related to promoting modal shift for these journeys. However, given the proximity of the large commercial / industrial units at the Westerhill business park the enhanced bus services could also offer sustainable access to Westerhill. Full implementation of the BRR may increase the viability of this option and maximise modal shift	Mainly residents from Bishopbriggs (including proposed developments such as Bishopbriggs East) commuting into/from Glasgow. Employees of the Westerhill Business Park by enabling enhanced bus services to the Westerhill area.	This option would provide a facility where people could park their private car and transfer to bus to commute into Glasgow via the BRR, M80 and M8. One of the issues associated with other modes (i.e. rail) is the lack of parking spaces at stations. Therefore, it is expected that this intervention could achieve a degree of modal shift. Lack of low cost parking in Glasgow, combined with the issues around the stations at Bishopbriggs and Lenzie.	In terms of travel times, existing services suggest that bus is comparatively worse than rail. However, the provision of car parking spaces may make bus more attractive. Typical journey times by bus from Westerhill to Glasgow are approximately 40mins. The existing service to which this time relates does not represent a journey time of an express service. The X81	<ul> <li>Users: better access to bus services by provision of parking spaces.</li> <li>Improved sustainable access to Westerhill Business Park.</li> <li><i>Non-Users</i>: modal shift (if achieved) would release road and rail capacity.</li> <li>Potentially help mitigate traffic increases generated by the new housing developments in East Bishopbriggs.</li> </ul>	WERE AND

Option	What is it?	Rationale for taking forward to STAG 2	Who is it aimed at / Who would use it?	Why would people change to this mode?	How competitive is it with other modes/options?	Anticipated benefits: Users and Non-Users	Indica
	the main bus operator in the area. This facility may need to be subject to parking management otherwise it could be used as an effective overspill car park for workers at the Westerhill Business Park. Without restriction it may increase car travel rather than reduce, and limit spaces for commuters to Glasgow. The frequency of bus services would be dictated by commercial viability. For the purposes of the appraisal it is assumed that the facility would be served by new buses, in addition to the possibility of diverting the existing express X81 service, in discussion with First Glasgow. The appraisal assumes a service frequency of 15 minutes in the peak period and 30 minutes in the off- peak period.	opportunities.			which terminates near Westerhill has a journey time of approximately 25mins therefore it is likely an express service from Westerhill would have a 30mins journey time.		
6 - Kirkintilloch / Lenzie Loop Bus	A potential new loop bus service linking key locations such as Lenzie Railway Station, Kirkintilloch Town Centre, Woodilee, residential areas and the Council main offices. The frequency of bus services would be dictated by commercial viability, however for the purposes of the appraisal it is assumed that the service would operate every 15 minutes in each direction during the peak period and every 30 minutes in each direction during the off-peak period.	This option requires further definition but overall, it is designed to improve access to key trip attractors within the study area by public transport, and will benefit the local population in particular, with some potential modal shift impacts. Currently Lenzie Rail Station is remote and not accessible to many residents of Kirkintilloch and Woodilee in particular. The use of Lenzie Rail Station for a large number of residents is dependent on the car. Furthermore for those employed in Kirkintilloch, Lenzie Rail Station is remote therefore many will commute by car. The creation of a bus link to key employment areas could encourage modal shift to the train.	Residents of Kirkintilloch and Lenzie. Commuters to Kirkintilloch and Lenzie. Car park users of Lenzie Rail Station if a number of people who currently drive to the rail station switch and use the bus.	A new bus service linking key locations is likely to attract users making local trips.	Being a local measure, this option has the potential to encourage modal shift from car to bus for short journeys.	Localised measure aimed at improving accessibility. No major impacts on mode shift anticipated. - Users: better access to rail services by provision of link bus service.	

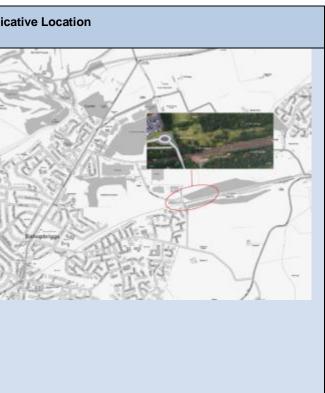

Option	What is it?	Rationale for taking forward to STAG 2	Who is it aimed at / Who would use it?	Why would people change to this mode?	How competitive is it with other modes/options?	Anticipated benefits: Users and Non-Users	Indi
7 - Increase parking Provision at Lenzie Rail Station	<ul> <li>a) Surface access:</li> <li>Potential to extend northern car park to create 100 additional spaces. Potential to combine with any works to make station more accessible (current footbridge with stairs only).</li> <li>b) Deck over Lenzie Rail station:</li> <li>Surface access Car parking deck over one, or both, of the existing car parks, and possibly over the track. Up to 200 new parking spaces. Potential to combine with any works to make station more accessible (current footbridge with stairs only).</li> </ul>	The existing car park at Lenzie rail station is currently operating at capacity after the weekday AM commuting peak. The limited growth in rail patronage at Lenzie station in comparison to other local stations with similar service levels suggests there is some constraint on growth, which may be due to the unavailability of reliable parking at the station.	Users of Lenzie rail station primarily, although there is a possibility that it would be used by non- users who need to park in the vicinity of the rail station.	The car park at Lenzie station currently operates above capacity, which leads to parking demand overspilling onto the surrounding residential streets. Park & Ride surveys undertaken by SPT <sup>13</sup> show that the main reason for on street parking (74%) is the car park at Lenzie station is too busy.	Although this option does not apply to a specific mode itself, it is associated with rail. It has already been commented that rail journey times are comparatively better than car or bus and thus providing increased station parking would increase the attractiveness of rail.	<ul> <li>Users: better access to rail services by increased provision of parking spaces. This, however, may lead to increased rail patronage and hence more overcrowding.</li> <li><i>Non-Users</i>: provision of more parking spaces would reduce on-street parking, benefiting residents near Lenzie station. On the other hand, this option is likely to have a negative environmental impact on the Lenzie Moss Local Nature Reserve.</li> </ul>	ないので、「「「「「「「「」」」」であるというです。
8 - Develop a New Rail Station at Woodilee (with Park & Ride) and Promote Sustainable Access	A new rail station to improve sustainable access to Woodilee. Possible location for a rail station is between the A806 Initiative Road and Calfmuir Road in the existing railway cutting. Depending on the size of rail station required, a station building and car park may be best located on land to the south of the track, since there is more land adjacent to the tracks available there, without the constraints of the recent residential developments that have taken place on the northern side. A car park with 50 spaces is assumed. Trains to and from Stirling would provide a 30 minute frequency.	The new Woodilee housing development will increase the demands on the local transport network. A broad area of land has been identified within Local Plan 2 and the draft Local Development Plan for a potential rail station with Park & Ride. However, there are significant deliverability issues with this option.	Primarily aimed at residents of the Woodilee site, which is currently being developed. It could also be used by residents in Kirkintilloch, specifically those living to the east of the KLR (as this station would be closer than Lenzie station).	For commuting trips into Glasgow primarily, but also Edinburgh, rail is comparatively faster than other modes (i.e. car or bus). A new station would make rail more accessible to certain people, who may in turn consider this mode over others.	Rail journey times between the study area and Glasgow are shorter than car or bus journey times.	<ul> <li>Users: increased access to rail to a certain part of the population. However, new stations are likely to increase rail patronage on already overcrowded services (as suggested by anecdotal evidence).</li> <li>Non-Users: Although technically and operationally feasible in theoretical terms, there remain uncertainties over the introduction of a new stop on the Edinburgh- Glasgow line. This would have a negative impact on overall journey times between Glasgow and Edinburgh. The site is also in relatively close proximity to Lenzie station.</li> </ul>

		this option.					

It should be noted that at STAG 1 stage, the bus-based Park & Ride Options (Options 4 and 5) were described as having associated bus priority measures. Subsequent consideration of these Options and site investigations of potential locations have deemed the implementation of bus priority as being unrealistic at this stage. For the purposes of the STAG Part 2 appraisal reference to bus priority has been removed.

More detailed information relating to the option appraisal assumptions can be found within Appendix B.

#### 3.2 The Key Issues

The key issues affecting the implementation of the options can be summarised as follows:

- Affordability the cost of the measures requires to be in proportion to the benefits that they achieve, and also the availability of funding.
- Degree to which modal shift can be effectively achieved modal shift depends not only upon the quality of the alternatives to car use, but also on the available restraints to car use.
- Optimising of individual elements the most effective strategy will be determined from a combination of mode share measures, and targeted infrastructure improvements.
- Delivery many aspects of delivery remain out with the control of East Dunbartonshire Council. These include many operational issues related to bus and rail services, wider government policy regarding sustainable transport, and wider social responses towards policies which encourage a change in travel patterns.

#### 3.3 Rail Station Feasibility Review

The work undertaken during STAG Part 1 included a Rail Feasibility Review to consider key issues pertaining to the provision of additional parking at the existing Lenzie station (and Bishopbriggs station, an Option which has been set aside following the STAG Part 1 appraisal), and the feasibility of two additional rail stations on the same railway line (Westerhill and Woodilee). The feasibility review undertaken at STAG Part 1 has subsequently been revisited in light of the more recent Rail Operational Modelling outputs (see below) and it is noted that there are no material changes identified. However, for completeness and to aid the reader, the Rail Feasibility Review is provided within Appendix C.

#### 3.4 Rail Operational Modelling

#### 3.4.1 Overview

Following the STAG 1 appraisal and prior to the STAG 2 appraisal, additional work was undertaken to assess the timetabling issues arising from the addition of stops at the potential Woodilee and Westerhill rail stations to ascertain if these Options would, in theoretical terms, be feasible. It is assumed that the proposed new rail stations would be served by the stopping trains that run about every 30 minutes in the off-peak timetable between Glasgow Queen Street and Stirling (continuing to Dunblane or Alloa). With the exception of shorter journey times arising from the use of electric trains, it is assumed that the infrastructure and factors governing timetable planning remain. It is also necessary to make certain assumptions regarding the service pattern and rolling stock types that will apply in the future, and further details are provided within Appendix D.

The route currently carries trains about every 15 minutes between Glasgow and Edinburgh, which join and leave the Stirling route at Greenhill Upper Junction. Alternate trains stop at Croy with the others being non-stop over this section. Thus there are four "gaps" between fast trains in every hour. The Stirling stopping trains occupy two of these with an Aberdeen or Inverness fast train occupying one or two, leaving some capacity available for other services.

All passenger services are currently operated by and timed for diesel multiple unit trains. However committed electrification schemes will see the Glasgow-Edinburgh and Stirling stopping trains replaced by electric multiple units (EMUs) with greater acceleration. Hence the baseline assumes that these workings run at current frequencies but in faster timings consistent with the performance of modern EMUs with a top speed of 100mph. These timings have been estimated using AECOM's ARTEM train performance model, which has been shown to give good correlation with working timetables on a wide variety of projects and when set to give the appropriate diesel timings also correlates well with the times of the stopping services between Glasgow and Stirling. As an example, Table 3.2 shows the correlation between the Working Timetable for an existing stopping service and the time predicted by the ARTEM model using the equivalent train characteristic.

Location	Out time	WTT
Glasgow Queen St High Level	0:00:00	0:00:00
A	0:06:04	0:06:00
Bishopbriggs	0:06:34	0:06:30
A	0:10:39	0:11:00
Lenzie	0:11:39	0:12:00
A	0:17:36	0:18:00
Croy	0:18:06	0:18:30
Greenhill Upper Jn	0:24:03	0:24:30
Greenhill Lower Jn	0:24:36	0:25:00
Larbert Jn	0:27:20	0:28:00

Table 3.2: ARTEM/Working Timetable Correlation

## 3.4.2 Outcomes

# 3.4.2.1 Off-Peak Baseline Timetable

With current stopping patterns ARTEM indicates that the electric stopping train requires 8.5 minutes from leaving Croy to arriving at Bishopbriggs or vice versa, inclusive of an intermediate stop at Lenzie. This increases to 11.5 minutes with the two extra stops, each with a dwell time of 30 seconds as used at other stops on the route, or to 12 minutes if a 60 second stop is made at Lenzie as happens with the current service. Even with these stops included it is possible for the stopping train to fit into the "window" between Edinburgh trains, provided that, as now, it precedes the service that stops at Croy out of Glasgow and follows it into Glasgow. All intervals between trains are compliant with Network Rail's Timetable Planning Rules and the timetable has been checked to be conflict-free with Glasgow trains as far as Dunblane and Alloa (trains between these stations and Edinburgh are assumed to be adjusted to fit the electric timetable and thus not to constrain the Glasgow trains).

Therefore it may be concluded that these two stops are operationally feasible under a timetable giving Glasgow-Edinburgh services about every 15 minutes, assuming the stopping services are operated by modern 100mph electric units.

# 3.4.2.2 Peak Services Timetable

The peak extra services in today's timetable<sup>14</sup> have also been assessed, including associated empty workings, based on today's timetable with electric units substituted on those services that do not run beyond the future electrified network. To achieve this, the trains concerned have been re-timed in some cases, and some timing margins have been reduced where they are above the

<sup>&</sup>lt;sup>14</sup> As of November 2014

minimum stipulated in the Network Rail timetable planning rules. Arrival and departure times at Glasgow Queen Street have remained the same as per the current timetable.

- The Dundee to Glasgow Queen St service arriving 07.34 cannot stop at Woodilee or Westerhill.
- The Lenzie to Glasgow Queen St service arriving 07.47 can come into service at Croy and serve one of the new stations, or could serve both if a train from Edinburgh ran 1½min later.
- The Alloa to Glasgow Queen St service arriving at 08.04 can stop additionally at Woodilee and Westerhill.
- The Perth to Glasgow Queen St service arriving 08.19 can stop additionally at Woodilee and Westerhill.
- The Aberdeen to Glasgow Queen St service arriving 08.34 can stop additionally at Woodilee and Westerhill.
- The Alloa to Glasgow Queen St service arriving 08.52 cannot stop at Woodilee or Westerhill unless several trains are retimed.
- The Dunblane to Glasgow Queen St service arriving 09.03 cannot stop at Woodilee or Westerhill.
- The 16:33 departure from Glasgow Queen St to Lenzie can be extended to Croy with stops at Westerhill and Woodilee.
- The 16.48 departure from Glasgow Queen St to Dunblane can stop additionally at Westerhill and Woodilee.
- The 17:03 departure from Glasgow Queen St to Falkirk Grahamston can stop additionally at Westerhill and Woodilee.
- The 17.19 departure from Glasgow Queen St to Alloa can stop additionally at Westerhill and Woodilee.
- The 17.33 departure from Glasgow Queen St to Markinch cannot stop at Westerhill or Woodilee unless several trains are retimed.
- The 17.49 departure from Glasgow Queen St to Dunblane can stop additionally at Westerhill and Woodilee.

In practice, the provision of peak services is affected by a range of issues including the level of crowding on existing trains and the times at which extra trains and timetable paths are available. While the basic off-peak service pattern is likely to stay broadly similar under electrification, the extra peak services (and extra stops in services that normally do not stop) could change significantly. Hence the results above are no more than indicative of the type of peak provision that might be possible, provided there is capacity on the trains in question.

# 3.4.3 Summary

Whilst theoretically feasible, it should be noted that the rail industry may question the acceptability of additional stops on the Edinburgh – Glasgow rail network, in particular the associated impact on resilience.

It is recommended that if these two stations are taken forward, the proposed locations should be reviewed against the infrastructure requirements of EGIP Phase 2<sup>15</sup>. If EGIP Phase 2 affects the station design and is a committed scheme by that time, then it would be most cost-effective to defer the new stations to be implemented at or after EGIP Phase 2. Otherwise consideration should be given to making the stations easily modifiable for any EGIP Phase 2 requirements, for example setting the station buildings back from the platform edge and building the platforms from modular elements which allow them to be reduced in width to accommodate future slow lines.

<sup>&</sup>lt;sup>15</sup> There is currently no timescale associated with EGIP Phase 2, however EGIP Phase 1 is scheduled for completion in 2016.

# 3.5 Summary

This Chapter has provided an overview of the additional work undertaken following the STAG Part 1 appraisal. It has provided a brief overview of the option development process undertaken to further define those Options which will be reviewed during the STAG Part 2 appraisal. It has also outlined the additional rail modelling work which has been undertaken to further assess the operational feasibility of implementing new rail stations at Woodilee and Westerhill, and the rail station feasibility work undertaken at STAG Part 1 has been revisited.

The following Chapter outlines the consultation which has been undertaken to inform the STAG Part 2.

4 STAG Part 2 Consultation

# 4 STAG Part 2 Consultation

#### 4.1 Introduction

Following the STAG Part 1 appraisal and identification of options to be taken through to the STAG Part 2 process, further consultation was undertaken to inform STAG Part 2. The consultation comprised three key strands:

- An appraisal workshop with key external stakeholders.
- Telephone interviews with stakeholders who were unable to participate in the workshops but expressed an interest in being involved.
- Key stakeholder engagement.

Each strand of consultation is considered within the Sections below.

## 4.2 Appraisal Workshop

An appraisal workshop was held at East Dunbartonshire Council's Head Quarters in Kirkintilloch on 06 November 2014 to discuss options being considered in the STAG 2 process and to gain feedback on each of the options and an indication of public acceptability. Invitations were sent to an extensive list of key stakeholders representing local communities and organisations covering active travel, bus, rail, health, tourism and economic development, including local businesses.

Details of those organisations who attended the workshop, together with those who were invited to the workshop but unable to attend, are provided in the Workshop Outcomes Handbook which is contained within Appendix E.

The workshop commenced with a review of the findings from the STAG Part 1 appraisal and an overview of the options being considered. The attendees were split into three groups, each with one facilitator, to discuss the options taken forward to the STAG Part 2 appraisal. The findings of the workshop are set out within the Workshop Outcomes Handbook, and a summary is provided within Chapter Five (Public Acceptability).

Workshop invitees were provided with a comments form and contact details to enable further or additional comments to be made in advance of, or following, the workshop.

#### 4.3 Telephone Interviews

Telephone interviews were offered to workshop invitees who were unable to attend the workshop but who were keen to provide input to the study. At the time of reporting, one telephone interview had been requested and undertaken by members of the AECOM study team, as follows:

Sustrans' – Cycling Officer for East Dunbartonshire

A telephone interview was undertaken with the Sustrans Cycling Officer for East Dunbartonshire in mid-November 2014. In general terms the discussion centred on the rationale for setting aside specific active travel and cycling Options following the STAG 1 appraisal. It was indicated that such measures would be considered by East Dunbartonshire Council through existing local transport policies, for example the Local Transport Strategy. It was further acknowledged that although specific active travel options were not being considered, some of the proposed Options had active travel measures associated with them and, where possible, links to active travel provision would be maximised.

# 4.4 Key Stakeholder Engagement

During the STAG 2 process, key stakeholders have been further engaged through meetings, discussions and written communication. The purpose of this engagement has been to inform stakeholders of the work being undertaken and to allow the opportunity for stakeholders to contribute to the appraisal process. A brief summary of key stakeholder input is provided below.

Transport Scotland

A meeting was undertaken in October 2014 with representative of the Technical Analysis team within Transport Scotland and their consultants JMP to discuss the outcomes of the STAG Part 1 process and the proposed approach for the STAG Part 2. A key point in Transport Scotland's response related to a requirement for greater clarity on the nature, location and scale of the evidence-based transport problems and how these link to the TPOs from the Pre-Appraisal and Initial Appraisal exercises. In response to this, Appendix A presents further information on the problems in the study area and seeks to clarify the relationship between the TPOs and identified problems and opportunities. Other key issues arising from this meeting related to a requirement to further "SMARTen" the transport planning objectives for the study, in particular the inclusion of clearer measurable targets, and to revisit the Options relating to provision of new rail stations at Woodilee and Westerhill in terms of meeting the transport planning objectives and STAG criteria prior to taking these options forward to a full STAG Part 2 appraisal. It is considered that these comments have been dealt with, as discussed within Section 5.3 (transport planning objectives) and Chapter Three (rail modelling).

Kirkintilloch Masterplan Team

A meeting was undertaken in November 2014 with representatives from the Kirkintilloch Masterplan Team. The purpose of this meeting was to further explore the Masterplan aspirations for Kirkintilloch town centre and, in particular, to ensure that proposals associated with the creation of a bus hub within Kirkintilloch town centre would complement the wider Masterplan proposals. The meeting was useful to gain a greater understanding of the Masterplan proposals and concluded that the option to create a bus hub within Kirkintilloch town centre would fit with wider plans and policies for the Kirkintilloch area.

During the meeting it was confirmed that the proposals for Kirkintilloch Town Centre include the creation of shared surface areas throughout the town centre; enhanced public realm and spaces; enhanced walking, cycling and bus facilities; and improved crossing facilities. It was indicated that the Masterplan team are due to consult on design principles in mid-December prior to undertaking a detailed design exercise. It is anticipated that construction will commence in July 2015.

North Lanarkshire Council

It was noted during the consultation workshops that North Lanarkshire Council has outlined a proposal within its City Deal bid to provide a Park & Ride facility south of the M80 Hornshill Junction (Junction 3). Further discussions were undertaken with a member of the Traffic and Transportation Team within North Lanarkshire Council to establish the status of the proposal and how it would impact upon the Option to provide a Park & Ride facility in the vicinity of the B757 / KLR (Option 4). It was noted that the proposal is highlighted within North Lanarkshire Council's City Deal bid, which is still being worked upon and has had no formal approval, and thus it was considered appropriate to progress with the Park & Ride Option within Lenzie, but with due cognisance to North Lanarkshire Council's Hornshill Junction proposals.

Glasgow City Council

E-mail communication was received from a representative from Glasgow City Council's Development and Regeneration Service's department following the stakeholder workshop. Key points to note related to a requirement for the new rail station options (Options 8 and 9) to avoid jeopardising the benefits that EGIP will generate for "inter-city" rail services - in particular the flagship Glasgow to Edinburgh shuttle; and due consideration to be given to the relative close proximity of a new station at Westerhill to the new Park & Ride station that Glasgow City Council / SPT is seeking to construct at Robroyston (at the time of reporting, Network Rail were in the process of being commissioned to produce a GRIP 4 design).

Network Rail

AECOM undertook consultations with Network Rail via a tele-conference in December 2014. The primary purpose of this exercise was to discuss the engineering and operational feasibility of rail stations at Westerhill and Woodilee. The general feedback received was any station proposal would need to demonstrate that it had no disbenefit to rail operations, including the emerging EGIP works.

• SPT

A telephone consultation was undertaken with a member of the Network and Planning Team within SPT to discuss the Kirkintilloch loop bus Option. Concerns were raised over the commercial viability of a bus loop service in Kirkintilloch / Lenzie. It was noted that a similar loop service operates in Bishopbriggs and costs £1,550 per week for an off-peak level of service, equating to a subsidy of £4 per passenger. For a Kirkintilloch loop bus service to be viable, it is expected that a large level of subsidy funding would be required and this could not be met by SPT.

• EDC Councillor Members' Briefing

A presentation on the study was given to Members of EDC's Transportation Working Group on 27<sup>th</sup> January 2015. The purpose of this was to provide Members with an update on the study's progress and to gain feedback on the emerging issues, including views on the options under consideration.

# 4.5 Summary

This Chapter has provided an overview of the consultation process undertaken to inform the STAG Part 2 appraisal.

The following Chapter details the STAG Part 2 appraisal of each option.

5 STAG Part 2 Appraisal

# 5 STAG Part 2 Appraisal

#### 5.1 Introduction

The sections below present the outcomes from the STAG Part 2 appraisal and focus in turn on each of the objectives of Environment; Safety; Economy; Integration; and Accessibility and Social Inclusion. Consideration is also given to Cost to Government, Deliverability and Public Acceptance. AST2s for the scenarios appraised are contained within Appendix F.

# 5.2 Options

As outlined earlier within the report, following the STAG Part 1 appraisal, and discussions with the Client group, the following options have been selected for appraisal at STAG Part 2 level:

- Option 1 Do Minimum committed schemes including Bishopbriggs Relief Road (i.e. up to and including phase 5); Split Cycle Offset Optimisation Technique (SCOOT); Kirkintilloch Town Centre Regeneration; Parking Strategy and Decriminalised Parking Enforcement; EGIP Phase 1; Glasgow City Council family cycling routes; and Glasgow City Council City Centre Strategy.
- Option 2 A803 Quality Bus Corridor Package.
- Option 3 Bus Hub in Kirkintilloch.
- Option 4 Bus Park & Ride in the vicinity of the B757 / KLR.
- Option 5 Bus Park & Ride adjacent to BRR.
- Option 6 Kirkintilloch / Lenzie Loop Bus.
- Option 7 Increase parking Provision at Lenzie Rail Station.
- Option 8 Develop a New Rail Station at Woodilee (with Park & Ride).
- Option 9 Develop a New Rail Station at Westerhill (with Park & Ride).

Further details regarding the Option assumptions are set out within Appendix B.

# 5.3 Transport Planning Objectives

Following feedback from Transport Scotland, the transport planning objectives developed for STAG Part 1 have been further refined such that they more clearly meet the SMART (Specific, Measurable, Attainable, Relevant and Timed) criteria required by STAG. The objectives are set out within Table 5.1, below. It should be noted that the transport planning objectives remain unchanged, but additional clarity has been provided to give better definition.

AECOM Transportation

ТРО	Specific	Measurable	Attainable	Relevant	Timed
1: To promote modal shift to sustainable transport modes for trips to key attractors outside of the study area, particularly commuting journeys.	Objective relates to modal shift and can be attributed from trips generated from specific geographical areas.	Travel to Work (and school) Data from various sources. Census data. Halt increase in car use for travel to work journeys.	Requires a joined-up and multi-agency approach, requiring support from transport providers and policy makers at all levels.	This objective accords to policy at all levels seeking a transfer from car trips to other modes. Modal shift will assist in the reduction of future traffic growth during peak times.	A base datum can be taken i.e. 2011, in line with the most recent travel to work data. The objective should be related to a 10-year period e.g. to 2024.
2: Improve public transport journey times and journey time reliability through the study area.	Objective relates to reducing the impacts of congestion and vehicle queuing in the study area by delivering options that improve journey times for public transport users and car drivers.	Journey time surveys through the study area. Moving Observer Method. Seek 2-minute improvement on 2014 AM Peak survey results (Strathkelvin Retail Park to Bishopbriggs, Bus Average JT 16 mins, car 11 mins)	Requires investment in measures to reduce levels of queuing, including both infrastructure and service improvements i.e. partnership working with public transport operators will be required.	Known congestion issues through town centres and sections of A803 through to Glasgow boundary.	This objective should be related to a 10-year period from 2014 to 2024.
3: Improve accessibility by sustainable transport modes to key trip attractors within the study area.	Objective relates to improving access and increase the uptake of sustainable modes of transport.	Accessibility can be measured through accessibility mapping, focusing on extent of populations within a specified journey time. This Objective would be measured through use of the SIMD Geographical Access to Services tool, comparing changes over time, and seeking to achieve a reduction in journey times to key services, as defined within SIMD.	Requires investment in both hard and soft measures to raise awareness to the availability of sustainable modes and increase their attractiveness.	Accessibility from the study area is arguably good, with the presence of rail networks and services. Accessibility to locations within the study area could be improved.	This objective should be related to a 10-year period from 2014 to 2024.

# Table 5.1: SMART Transport Planning Objectives

AECOM Transportation

ТРО	Specific	Measurable	Attainable	Relevant	Timed
4: Deliver a transport network that supports improvements to human health and air quality, while minimising the impact on the environment.	Objective seeks to address issues of air quality, healthy living and environmental protection.	Air quality monitoring; increases in the uptake of active travel, and implementation of any mitigation measures will be used to monitor the impact of this objective. Objective should be to meet or exceed the air quality management targets as set out within Air Quality (Scotland) Regulations 2000 (Scottish SI 2000 No 97), the Air Quality (Scotland) (Amendment) Regulations 2002 (Scottish SI 2002 No 297): annual mean NO <sub>2</sub> concentration 40 µg/m3; annual mean PM <sub>10</sub> concentration 18 µg/m3.	Delivery of measures that have a reduced environmental impact will help to deliver this objective.	Bishopbriggs has a designated Air Quality Management Area. There are also various sites of environmental and historical importance within the study area and impacts should be minimised.	This objective should be related to a 10 year period from 2014 to 2024.
5: Provide a sustainable transport network that supports local development, regeneration and contributes to the sustainable economic growth of the study area.	Objective relates to the use of transport interventions to encourage inward investment and economic growth, as well as the development of vibrant, attractive town centres.	Footfall and vacancy rates are national indicators that are used to assess the health of town centres. Town centre footfall and percentage of town centre retail vacancies vs total number of town centre retail units will be monitored in line with targets set out within EDC's Development and Regeneration Business and Improvement Plan 2015-18 (e.g. annual target 2015/16: footfall 3M, vacancy rate 11%)	Objective requires partnership work of various agencies - both transport, planning and enterprise, from the public and private sectors, to deliver transport interventions that support this goal.	Local planning issues have been identified as an issue for consideration as part of this study. EDC also aspire to encourage wider economic growth and sustainable place making such as through the Kirkintilloch Town Centre Masterplan.	This objective should be related to a 10-year period from 2014 to 2024 and support the proposals outlined in the existing and emerging EDC LDP. It should also be monitored in line with the monitoring schedule set out within EDC's Development and Regeneration Business and Improvement Plan 2015-18, and subsequent publications.

# 5.4 Transport Modelling Overview

The transport modelling approach adopted for the appraisal has been conducted through the use of CSTM12, a multi-modal transport model covering the main road and public transport network of the Central Belt of Scotland. CSTM12 has been developed by Transport Scotland and contains road and public transport assignment models and Park & Ride and demand model processes. These provide a forecasting methodology to predict changes in travel demand and transport costs over time. CSTM12 also provides an appraisal tool that can be used to assess the operational, economic and environmental impact of transport schemes, policy proposals and development strategies.

CSTM12 was developed using Cube Voyager software and it reflects traffic and travel conditions in a 2012 Base Year. It also provides forecast year scenarios which predict transport-related impacts associated with various transport interventions and development plans. This programme has allowed the options to be tested and evaluated in line with STAG requirements.

Appendix B sets out details of the Option development and appraisal assumptions.

# 5.5 Environment

There are a number of ways the environment can be affected through implementation of the above Options. In the following sections, each Option is assessed according to the impacts it might have on noise and vibration pollution, air quality, water quality, flooding and drainage, geology, biodiversity, agriculture and soils, visual amenity and cultural heritage.

Potential impacts on environmental receptors are dependent upon the nature and proximity of the proposals and the works associated with their development. Therefore where the final location or defined description of the Options is not available, the potential effects described within the Sections below and the magnitude of these effects are subject to change. General mitigation measures have been included for each environmental topic area. The exact mitigation measures and extent of mitigation required cannot be determined until detailed design stage.

It is also to be noted that to accompany this STAG report, a separate Strategic Environmental Assessment (SEA) has been undertaken.

# 5.5.1 Noise and Vibration

5.5.1.1 Introduction (including key issues)

Road traffic noise is one of the most extensive sources of environmental noise pollution. Exposure to high levels of noise and vibration can have an adverse impact on both human health and on the perceived quality of life. The magnitude of effect will vary amongst individuals; however, for the purpose of the STAG assessment the potential effects of noise and vibration are considered on a community basis.

It should be noted, that this assessment has been informed by a desk study only and that no site surveys measuring existing ambient noise, noise contour modelling or vibration modelling has been undertaken.

A number of factors can influence the level of noise and vibration generated by traffic. These include:

- Traffic volumes;
- Percentage of HGVs within the total traffic volume;
- Speed of traffic;
- Road surface material;
- Distance between noise / vibration source and receptor;

- Ground cover between noise/ vibration source and receptor; and
- Screening of intervening land between the source and the receiver.

## Option 1: Do Minimum

The schemes included within the Do Minimum approach are unlikely to result in significant disturbance from noise and / or vibration. Those at greatest risk to increased disturbance are residents within Bishopbriggs East and industry and business based at Westerhill Business Park which will experience construction and increased traffic noise from the Bishopbriggs Relief Road (BRR). However given that the BRR (along with the other schemes as part of the Do Minimum scenario) has been consented (up to Phase 4) by East Dunbartonshire Council it is assumed that adequate mitigation measures have / will be incorporated at project level to reduce or avoid any potentially significant impacts.

# Option 2: A803 Quality Bus Corridor Package

Changes to service patterns on existing routes are unlikely to have significant effects from noise or vibration. The introduction of discontinuous bus priority lanes may result in greater congestion of private vehicles between Torrance Roundabout and Colston Road and associated increased noise and vibration levels from idling vehicles and frustrated road users, however this is not likely to be significant.

## Option 3: Bus Hub in Kirkintilloch

Noise and vibration disturbance from this Option is highly dependent upon the final design of the Option and the scale of the intervention(s) adopted. Regardless, any new infrastructure requirement will bring temporary (construction) noise and vibration disturbance to the town centre area which is utilised for residential, employment and socialising / leisure purposes. Should the Option propose to develop a single centralised bus hub, it is likely that there will be permanent (operational) noise and vibration disturbance to receptors within the near vicinity of its location. This represents the worst-case-scenario for this Option.

Other softer interventions proposed within the Option, such as access improvements, improved shelters, and greater public transport information may require some construction activities but will not result in any significant increase in noise or vibration levels.

Noise levels will depend on the detailed alignments, elevations, topography and the proximity and sensitivity of noise sensitive receptors.

## Option 4: Bus Park & Ride in the vicinity of B757 / KLR

The development of a Park & Ride scheme would draw volumes of traffic to that particular location that did not previously experience such volumes of traffic, therefore increasing noise disturbance within the area. The Park & Ride scheme will ultimately aid a modal shift to more sustainable transport method and reduce traffic levels, however this reduction will not be significant. Noise sensitive receptors and the magnitude of effects are dependent on the final location of the facility.

There are two preliminary locations identified for the Park & Ride scheme – adjacent to the KLR or adjacent to the B757. Of the two locations it is likely that a greater number of receptors will be impacted from development of a Park & Ride scheme adjacent to the KLR. The significance of effect is dependent on the detailed alignments, elevations, topography and any potential mitigation measures included within detailed design and construction practices.

It is anticipated that the majority of noise effects may be mitigated for, during construction and incorporating noise barriers in to the final design of the scheme. Permanent impacts from noise and vibration from the development of a Park & Ride scheme are not likely to be significant.

Option 5: Bus Park & Ride adjacent to BRR

The development of a Park & Ride scheme would draw volumes of traffic to the immediate east of Westerhill Business Park and nearby residential areas, however this is also adjacent to the BRR which will increase noise in the area regardless of the Park & Ride scheme. The Park & Ride will ultimately result in reduced traffic levels, however this reduction is not likely to be significant. Noise sensitive receptors and the magnitude of the effects are dependent on the final location of the Park & Ride facility.

Permanent noise emitted from the Park & Ride will depend on the detailed alignments, elevations, topography and mitigation measures incorporated during construction and included within the detailed design.

## Option 6: Kirkintilloch / Lenzie Loop Bus

As there are no construction activities associated with this Option there will be no adverse noise or vibration impacts from constructing new infrastructure. There is minimal modal shift anticipated as a result of the implementation of this scheme, therefore there are unlikely to be any long-term effects (beneficial or negative) from noise and/or vibration effects.

## Option 7: Increase parking Provision at Lenzie Rail Station

Impacts from noise and vibration disturbance are likely to be negative over the long-term duration of the intervention, with some short-term negative effects during the construction phase due to the surrounding residential areas offering numerous sensitive receptors. Effects are dependent on the location of the additional parking facilities. Developing on top of the existing facilities may increase noise levels due to the higher elevation. Whereas developing on ground adjacent to the existing facilities will likely bring areas of noise generation closer to the surrounding noise sensitive receptors (residential properties).

Although the increased provision of car parking will draw a greater number of vehicles to the location of the rail station, it will deter rail patrons from using the surrounding residential streets for parking as an alternative.

It is anticipated that any increased noise and / or vibration effects would be minimal, and where necessary mitigation measures could also be utilised to further reduce these effects.

## Option 8: Develop a New Rail Station at Woodilee (with Park & Ride)

To develop a new rail station and associated access will require significant infrastructure development, resulting in temporary noise and vibration effects. Given the close proximity of the proposed location to the Woodilee residential area, the increase in additional traffic within the area will also likely increase noise and vibration during the operation of the rail station.

Noise and vibration mitigation measures implemented during construction and incorporated within the final design of the scheme will aid in reducing or avoiding any significant impacts from increased noise or vibration levels.

#### Option 9: Develop a New Rail Station at Westerhill (with Park & Ride)

To develop a new rail station and associated access will require significant infrastructure development, resulting in temporary noise and vibration effects. Any anticipated increase in traffic volumes to the area are likely to be incorporated within the users of the BRR once completed and would not likely increase volumes to a significant level. Increased noise and vibration disturbance will primarily impact the residential areas within Bishopbriggs East and Westerhill Business Park, to the west of the proposed station location.

Noise and vibration mitigation measures implemented during construction and incorporated within the final design of the scheme will aid in reducing or avoiding any significant impacts from increased noise or vibration levels.

# 5.5.1.2 Mitigation

Mitigation measures will be required for all Options that require new infrastructure to be constructed, that increase or generate additional noise and / or vibration or cause sensitive receptors to come within close proximity to new sources of noise and / or vibration.

General mitigation measures that may be developed to reduce or avoid significant impacts from noise and vibration are noted below. These have been separated between temporary (construction) and permanent (operation) mitigation measures.

Temporary mitigation should include:

- The use of fencing or other appropriate noise barriers around construction sites;
- Housing of continuous running plant in acoustic enclosures;
- Adherence to the codes of practice for construction working and piling given in British Standard BS 5228:1992;
- In particularly sensitive locations, the use of electrical items of plant as opposed to diesel plant; and
- Where practicable, avoid working during times most susceptible to noise and vibration effects (i.e. evenings and weekends).

Permanent mitigation should include:

- The use of acoustic noise barriers;
- Implementation of speed management measures such as traffic calming or speed cameras; and
- Where appropriate, noise insulation for receptors that may experience a major negative impact as a result of ongoing noise.

# 5.5.1.3 Summary

Table 5.2 below highlights the overall assessment of impacts from noise and vibration from the development of the Options. The assessment assumes that good construction practices will be followed where development is required, and that appropriate mitigation measures are incorporated within the final design. In the absence of environmental modelling data, these impacts are based on professional judgement only.

Option	Magnitude of Temporary Impacts	Magnitude of Permanent Impacts
Option 1	Minor Negative	Negligible
Option 2	Negligible	Neutral
Option 3	Minor Negative	Minor Negative
Option 4	Moderate Negative	Minor Negative
Option 5	Minor Negative	Neutral
Option 6	Neutral	Neutral
Option 7	Moderate Negative	Minor Negative
Option 8	Moderate Negative	Moderate Negative
Option 9	Moderate Negative	Neutral

#### Table 5.2: Noise and Vibration Impact Summary

# 5.5.2 Air Quality

#### 5.5.2.1 Introduction

Air quality is assessed at both local and global levels. Local air quality is impacted by the development of transport schemes based on the reduction or increase in emissions of pollutants such as: carbon monoxide (CO), volatile organic compounds (VOCs), nitrogen dioxide (NO2) and particulate matter (PM10), all of which can potentially negatively impact on human health, flora and fauna. Local air quality is measured directly against levels of NO2 and PM10.

At a global level, transport schemes can cause an increase or decrease in the release of carbon dioxide (CO2), singled out as the most important transport induced greenhouse gas having a direct impact on global warming. In STAG 2 appraisals, CO2 is taken as a proxy for global air quality. Given the scale of the study area and the level to which any modal shift will be achieved from the development of these Options, global air quality is not likely to be significantly impacted upon and has therefore been scoped out of assessment as part of this study.

The development of transport schemes can impact on air quality through their influence on the volume of traffic, type of traffic and travel time (or congestion) of traffic within a given network. The main ways in which a transport scheme may impact on air quality are detailed below:

- Volume of traffic public and sustainable transport, and developing greater, more accessible cycle and walking networks there may be a modal shift away from the use of private vehicles.
- Reduced congestion by implementing junction improvements, increasing network capacity and initiating signalling
  improvements can cut the time which vehicles are left idling within a given stretch of road increasing pollutants within the
  area.

The following sections outline the potential effects on air quality from the development of the proposed Options.

#### Option 1: Do Minimum

Implementation of the Do Minimum scenario is likely to result in negative impacts on local air quality from the attraction of vehicle users to the area from reduced journey times. Should traffic be diverted away from the A803 route and signalling improvements ease congestion, there may be some beneficial impacts on the existing Air Quality Management Area (AQMA) located in Bishopbriggs on the A803 between Colston Road and the Torrance Roundabout. These benefits are not likely to be significant.

#### Option 2: A803 Quality Bus Corridor Package

Negative impacts on local air quality may be experienced on the A803 should bus priority measures be put in place, particularly at the already sensitive Bishopbriggs AQMA as a result of greater congestion of private vehicles along the route. Assuming the BRR is completed these effects should be largely mitigated by diverting through-traffic from this area. However, should a modal shift from private vehicles to quicker, more reliable buses be attained localised air quality benefits may be realised across the wider study area.

#### Option 3: Bus Hub in Kirkintilloch

The impact on air quality from the development of this Option is dependent upon the level of intervention implemented. Temporary effects will result from the construction of any new infrastructure required as part of the chosen intervention(s), however the magnitude of these effects will vary with construction effort.

Should there be a modal shift to bus usage within the town centre and traffic levels reduce air quality may improve.

The softer interventions associated with this Option, such as increasing accessibility by walking and cycling and improving bus shelters are unlikely to impact air quality – unless they contribute to reducing traffic volumes within the town centre.

37

# Option 4: Bus Park & Ride in the vicinity of B757 / KLR

There are likely to be negative effects on air quality from the construction of a Park & Ride scheme. The overall significance of these impacts is dependent upon the scale of the scheme and the mitigation measures that can be put in place to reduce or avoid these effects.

Long-term effects will likely occur as a result in a minor improvement in local air quality through the promoting of more sustainable modes of transport than the use of private vehicles. However this is provided that the Park & Ride does not abstract from users of rail or other bus services, which potentially it may.

## Option 5: Bus Park & Ride adjacent to BRR

There are likely to be negative effects on air quality from the construction of a Park & Ride scheme. The overall significance of these impacts is dependent upon the scale of the scheme and the mitigation measures that can be put in place to reduce or avoid these effects.

Long-term effects will likely occur as a result in a minor improvement in local air quality through the promoting of more sustainable modes of transport. However this is provided that the Park & Ride does not abstract from users of rail or other bus services, which potentially it may.

# Option 6: Kirkintilloch / Lenzie Loop Bus

The development of this Option is not likely to result in any notable effects on air quality.

## Option 7: Increase parking Provision at Lenzie Rail Station

Short-term effects are likely to occur during the construction of this Option, particularly with sensitive residential areas within the near vicinity.

Long-term effects on air quality are likely to be neutral, although it may increase rail patronage as a result of increased accessibility.

# Option 8: Develop a New Rail Station at Woodilee (with Park & Ride)

There are likely to be negative effects on air quality from the construction of the rail station and associated infrastructure and access requirements. The overall significance of these impacts is dependent upon the scale of the scheme and the mitigation measures that can be put in place to reduce or avoid these effects.

Long-term effects on air quality are likely to be neutral to minor positive. The Option encourages the use of more sustainable means of transport than private vehicles. The magnitude of the resultant decrease in emissions is dependent on the success of this modal shift.

## Option 9: Develop a New Rail Station at Westerhill (with Park & Ride)

There are likely to be negative effects on air quality from the construction of the rail station and associated infrastructure and access requirements. The overall significance of these impacts is dependent upon the scale of the scheme and the mitigation measures that can be put in place to reduce or avoid these effects.

As with Option 8, the long-term effects on air quality are likely to be neutral to minor beneficial. The Option will encourage the use of more sustainable forms of transport (than private vehicles) and therefore reduce emissions. The magnitude of these beneficial effects is dependent on the scale of modal shift achieved from the implementation of this Option.

## 5.5.2.2 Mitigation

Mitigation proposals for air quality mainly relate to construction issues and there are a number of mitigation measures that could be employed to lessen the potential impacts of any dust and PM10 generated during construction activities, should these situations arise:

- Increasing the distance of dust-generating activities and any sensitive receptors;
- Adoption of good working practices on the construction site (e.g. plant handling techniques, dampening of site, regular cleaning, good site maintenance);
- Specific construction traffic management measures; and
- The use of dense vegetation screens or barriers.

All potential dust-generating activities and locations should be identified prior to commencement of work.

#### 5.5.2.3 Summary

Table 5.3 below highlights the overall assessment of impacts on air quality from the development of the Options. The assessment assumes that good construction practices will be followed where development is required and that appropriate mitigation measures are incorporated within the final design. In the absence of environmental modelling data, these impacts are based on professional judgement only.

Option	Magnitude of Temporary Impacts	Magnitude of Permanent Impacts
Option 1	Minor Negative	Negligible
Option 2	Negligible	Negligible
Option 3	Minor Negative	Negligible - Minor Positive
Option 4	Minor Negative	Minor Positive
Option 5	Minor Negative	Minor Positive
Option 6	Neutral	Neutral
Option 7	Minor Negative	Neutral
Option 8	Minor Negative	Neutral – Minor Positive
Option 9	Minor Negative	Neutral – Minor Positive

#### 5.5.3 Water Quality, Drainage and Flood Defence

#### 5.5.3.1 Introduction

This section considers the potential effects of developing the Options may have on the water environment. For the purpose of this study the water environment includes water quality, drainage and flooding. A baseline desk study has been undertaken and surface waterbodies located within 500m of each element of the Options has been considered.

The development of transport schemes can impact on the water environment in a number of ways, during construction and from the operation of various transport interventions. Temporary effects on the water environment from the construction of a transport

scheme are detailed below. It should be noted that these are only likely where there are significant construction requirements, and receptors within the near vicinity:

- The natural drainage of the area will be altered during construction as a result of earthwork activities and dewatering of any excavations present on site;
- Water quality is likely to be heavily impacted during construction activities through increased sedimentation in runoff from earthworks, vegetation stripping and stockpiled material. The presence of plant and vehicles on site also presents the risk of pollution or contamination events from the leakage or spills of oils, fuel, hydraulic fluids, cement and concrete and other materials;
- Where development is proposed on current 'green space', increasing hardstanding areas will increase runoff rates/ decreased infiltration rates which could increase flood risk downstream of the development. Similarly, development within an existing flood plain or area at risk to flooding may result in greater flood extents due to reduced flood capacity; and
- Works on the banks of watercourses, channel modification and where watercourses are required to be crossed will alter channel geomorphology.

Permanent effects from the operation of a transport scheme will vary significantly between the various different types of schemes, and therefore have been described within the assessment of each Option in the sub-sections below. It should be noted that no water quality monitoring was undertaken as part of this assessment.

## Option 1: Do Minimum

The development of the Do Minimum is not likely to result in any impacts on the water environment. Although there is some significant development (e.g. BRR) and development within close proximity to water resources (e.g. Kirkintilloch town centre regeneration – Forth and Clyde Canal), as the various components of the Option are committed, any likely impacts are assumed to have been mitigated to an acceptable level at project level.

#### Option 2: A803 Quality Bus Corridor Package

Improving bus journey times and reliability will have no impact on water quality, drainage or flood defences.

#### Option 3: Bus Hub in Kirkintilloch

Impacts on the water environment are dependent on the scale of the intervention(s) adopted as part of this Option, and also the location of the development in relation to the water resources within the surrounding area.

The River Kelvin and the Forth and Clyde Canal both lie within close proximity to Kirkintilloch. Although of varying water quality (bad / poor ecological potential, and good ecological potential, respectively), both water bodies are designated under the Freshwater Fish Directive for salmonid waters. Where impacts may be experienced during the construction of the intervention(s), it is unlikely that any long-term impacts would result on the water environment, assuming any drainage systems meet regulatory requirements.

## Option 4: Bus Park & Ride in the vicinity of B757 / KLR

Impacts on the water environment are dependent upon the final location of the Park & Ride scheme. With the location not yet known, the resources that may be impacted upon and the proximity of the development to these receptors is unclear.

Based on outline locations considered, temporary effects are likely to impact either Bothlin Burn (Woodilee site) or Gadloch (B757 site). There are unlikely to be any permanent effects from a Park & Ride scheme within the B757 location, assuming mitigation measures are adopted as noted within the Mitigation section below.

Development of a Park & Ride scheme at the site adjacent to Woodilee may result in exacerbated flood risk of the Bothlin Burn due to increased runoff from hardstanding areas and reduced holding capacity within the catchment.

#### Option 5: Bus Park & Ride adjacent to BRR

Water resources within the surrounding area of the proposed Park & Ride scheme are limited to small field drains and areas of surface water as a result of poor drainage. Although these water bodies may be part of the wider River Kelvin catchment, temporary effects during construction are not likely to be significant.

The area to the south of the railway track is noted as being at risk to surface water flooding. The development of hardstanding area within the near vicinity may either displace or contribute to this area of floor risk. If so, a detailed flood risk assessment would be required.

#### Option 6: Kirkintilloch / Lenzie Loop Bus

Changes to service patterns on existing sections of the road network are unlikely to have significant impacts on the water environment.

#### Option 7: Increase parking Provision at Lenzie Rail Station

Temporary effects on the water environment during the construction of increased parking at Lenzie Rail Station would introduce a number of pollutants and potential contaminants which may impact on water resources that support the Lenzie Moss immediately adjacent to the site.

Permanent effects may also include the introduction of pollutants such as oils and fuels from parked vehicles to this area via the drainage system incorporated within the car park design. Although not monitored, the water resources within this area would deteriorate in quality. These impacts can be mitigated from the incorporation of appropriate SUDS measures within the drainage design, such as oil interceptors.

Secondary impacts on the ecology of the Lenzie Moss site are assessed within the Biodiversity and Habitats Section.

#### Option 8: Develop a New Rail Station at Woodilee (with Park & Ride)

Impacts of the development of a rail station at Woodilee are dependent upon the final location of the station and its associated infrastructure and access point. However it is likely that temporary effects from increased presence of pollutants and potential contaminants will impact on the Bothlin Burn, to the immediate west of the site. The wider area surrounding the site is also subject to flood risk from surface water and from the Bothlin Burn which may be increased during earthworks and compaction of soils from site activity.

Permanent impacts will likely be as a result of increased flood extents and potential water quality deterioration of the Bothlin Burn from oils and fuels leaking from parked vehicles. It is expected that these impacts can be mitigated within the design of the scheme.

# Option 9: Develop a New Rail Station at Westerhill (with Park & Ride)

Water resources within the surrounding area of the proposed rail station are limited to small field drains and areas of surface water as a result of poor drainage. Although these water bodies may be part of the wider River Kelvin catchment, temporary effects during construction are not likely to be significant.

The area to the south of the railway track is noted as being at risk to surface water flooding. The development of hardstanding area within the near vicinity may either displace or contribute to this area of floor risk. If so, a detailed flood risk assessment would be required. These impacts can be mitigated within the design of the scheme.

# 5.5.3.2 Mitigation

Temporary mitigation should include:

- Where any construction or engineering works are required within the water environment, the appropriate licenses will be held, as governed by SEPA (such as (WEWS) and the Water Environment (Controlled Activities) (Scotland) Regulations 2005 (CAR), and Pollution Preventions Guidelines (PPGs));
- All construction activities will follow good practice guidelines (such as Code of Construction Practice (CoCP)) and also the measures set out within an Environmental Management Plan prepared by the appointed Contractor;
- Temporary site drainage and treatment procedures, based on Sustainable Urban Drainage Systems (SUDS), will be put in place to manage surface water runoff and accidental spills of fuel, etc.;
- Measures would be put in place to prevent pollutants and/or suspended sediments entering surface watercourses;
- Should any development be proposed within an area at risk to flooding, a flood risk assessment will be carried out, addressing potential effects and additional relevant mitigation measures; and
- Temporary and permanent works, in particular culverts, would be designed such that they minimise the disruptions to flow and do not increase the risk of flooding.

Permanent mitigation should include:

- An appropriately designed drainage system that would collect and treat surface runoff from any hardstanding infrastructure development or improvements;
- The discharge of polluted surface water runoff into receiving watercourses could be mitigated by minimising the number of discharge points along the scheme length and using existing surface water drainage where possible;
- Adequate pollution control, such as oil/petrol interceptors would be incorporated into the drainage system of all new and upgraded road linkages; and
- Any engineering works undertaken within the water environment will be designed to ensure that the hydraulic capacity, resilience to flood risk, and morphology of the watercourse are not impeded or deteriorated. Where any negative impacts may occur, these may be offset by improvements made elsewhere.

#### 5.5.3.3 Summary

Table 5.4 highlights the overall assessment of impacts on water quality, drainage and flood defence from the development of the Options. The assessment assumes that good construction practices will be followed where development is required, and that appropriate mitigation measures are incorporated within the final design. In the absence of water quality monitoring data, these impacts are based on professional judgement only.

Table 5.4: Wate	r Environment	Impact Summary
-----------------	---------------	----------------

Option	Magnitude of Temporary Impacts	Magnitude of Permanent Impacts
Option 1	Negligible	Neutral
Option 2	Neutral	Neutral
Option 3	Minor Negative	Neutral
Option 4	Minor Negative	Neutral

1	2
4	2

Option 5	Negligible	Negligible
Option 6	Neutral	Neutral
Option 7	Minor Negative	Negligible
Option 8	Minor Negative	Negligible
Option 9	Negligible	Negligible

# 5.5.4 Geology

# 5.5.4.1 Introduction

Transport schemes could impact on geology in a number of ways including:

- Through damage to geologically valuable sites such as geological Sites of Special Scientific Interest (SSSIs) or Regionally Important Geological Sites (RIGS);
- Overloading of geological strata; and
- Damage to important mineral reserves that could be worked in the future.

Baseline geological information was obtained by means of a desk study review of currently available information. This included a review of published British Geological Survey (BGS) maps.

There are no geological SSSIs or non-statutory RIGS within the study area that may be affected by the Options. There are also no areas identified as being of importance for mineral deposits or areas previous used for extraction purposes. The solid geology that underlies the entire study area is the Clackmannan Group (an upper limestone formation). Superficial deposits within the study area include till, alluvium and small areas of peat.

As there are no sensitive geological receptors within the study area, any impacts on geological resources are not likely to be significant. Where geology (solid and superficial) will be affected will be during the construction of Options 4, 5, 7, 8 and 9 where excavation, extraction of material for development and/or to develop foundations for the structures. These effects will be permanent, but will not be significant.

The impact on geology from the development of Options 4, 5, 7, 8 and 9 will be Minor Negative. The impact from developing the remaining Options would be Negligible.

# 5.5.5 Biodiversity and Habitats

## 5.5.5.1 Introduction

This section considers the effects of the Options on the local biodiversity within the study area and its surrounding area. A review of designated sites and satellite images were carried out to determine key ecological issues. The key issues are set out in order dealing with protected species followed by protected sites. In both cases the hierarchy is descending from European (International) importance to UK (national) to local/ regional.

There are no statutory designated sites within the study area, however Cadder Wilderness and Possil Marsh SSSI are located just outwith the study area to the north and west of Bishopbriggs, respectively. Possil Marsh is also designated as a Scottish Wildlife Trust Reserve. There are several pockets of trees throughout the study area which are within the Ancient Woodland Inventory (AWI). There are also two Local Nature Reserves (LNR) within the study area – Merklands and Lenzie Moss. The Forth and Clyde Canal, River Kelvin and the railway line all offer important wildlife corridors through the centre of the study area.

From review of protected species records on NBN Gateway, there are records of European water vole (Arvicola amphibious), European Otter (Lutra lutra), and various bat species. Although other species may not have records of presence within the study area, this does not mean they are not there. Protected species and breeding bird should be further considered at project level should an impact assessment be required on any of the Options.

# Option 1: Do Minimum

Given that the multiple components of the Do Minimum have been consented, any effects on ecological receptors or habitat areas are not likely to be significant, or have been mitigated at project level to avoid or reduce any potential impacts.

Of the projects within this Option, it is presumed that ecological impacts would result from the development of the BRR, which requires substantial land take and passes within close proximity to a pocket of woodland listed within the AWI.

Impacts on biodiversity and habitats as a result of the Do Minimum are likely to be Minor Negative.

## Option 2: A803 Quality Bus Corridor Package

Should the development of this Option result in a modal shift to more sustainable transport, it is likely that there will be improved local air quality. As a result of this there may be improved biodiversity within local habitats surrounding the A803 corridor. These effects are not likely to be significant.

#### Option 3: Bus Hub in Kirkintilloch

The impacts from the development of this Option are dependent upon the location and intervention(s) adopted as part of this scheme. Biodiversity and habitats of relevance within Kirkintilloch town centre will be limited to parks and fragmented habitats. Should there be a proposed new bus hub where construction effort would likely be greatest, there may be scope to include habitat creation within design places to enhance the towns' biodiversity.

Impacts on biodiversity from the development of this Option are not likely to be significant.

#### Option 4: Bus Park & Ride in the vicinity of B757 / KLR

Impacts on the habitat areas are dependent upon the final location of the Park & Ride scheme. With the location not yet known, the resources that may be impacted upon and the proximity of the development to these receptors is unclear.

To develop the Park & Ride scheme at either location would likely result in land-take from areas of potential habitat value and probable tree removal to accommodate infrastructure. The wooded area at the site adjacent to Woodilee is also adjacent to a pocket of Ancient woodland listed within the AWI, which may be directly or indirectly impacted upon as a result of the construction and / or operation of a Park & Ride scheme in this area.

## Option 5: Bus Park & Ride adjacent to BRR

The area proposed for the development of this Option is currently used for agricultural purposes or woodland immediately adjacent to the north and south sides of the rail track. The railway line is identified as an important ecological corridor by East Dunbartonshire Council. The magnitude of effect on these areas is subject to the design of the scheme and the land-take required to accommodate the footprint of the Park & Ride scheme and associated access routes.

The woodland habitat and surrounding fields provide good foraging and potential roosting habitat for bats, and potentially other protected species such as badgers. Breeding birds may also be impacted should works be undertaken within the breeding season.

Option 6: Kirkintilloch / Lenzie Loop Bus

Changes to service patterns on existing sections of the road network are not likely to result in significant impacts on biodiversity and habitats within the study area.

#### Option 7: Increase parking Provision at Lenzie Rail Station

The extent of impacts from the development of this Option is dependent upon the choice of location of the additional car parking spaces, and its associated land-take.

To the immediate west of the current rail station to the north of the track is the Lenzie Moss LNR. To accommodate additional car parking that does not lie over either of the existing car parks would likely require land take from this area, resulting in the removal of several trees. Any decrease in air quality of the area during construction may also result in a deterioration of the biodiversity of this LNR site.

Permanent effects of the development would likely be limited to the use of lighting of the car park for safety and security purposes. Lighting this area may disturb bats that will be in use of the rail corridor for foraging, and potentially the woodland area within Lenzie Moss LNR for roosting.

#### Option 8: Develop a New Rail Station at Woodilee (with Park & Ride)

Impacts on the habitat areas are dependent upon the final location of the rail station, associated infrastructure and access.

The development of a rail station at this location would require the removal of mature trees and other areas of potential habitat value and introducing additional light sources to the area. These in turn would result in greater disturbance to protected species such as bats, badgers and breeding birds should they be in use of the area, and fragment an existing mature habitat area. There is also a pocket of Ancient woodland listed within the AWI directly north of this site, which may be directly or indirectly impacted upon as a result of the construction and/or operation of a rail station.

Negative effects on local biodiversity may also result from increased pollutants within the environment during construction and decreased air quality.

## Option 9: Develop a New Rail Station at Westerhill (with Park & Ride)

The area proposed for the development of this Option is currently an area of potential habitat value to the south of the railway line, with the area to north of the track being developed for housing. The track is lined to the north and south by mature and young trees. The railway line is identified as an important ecological corridor by East Dunbartonshire Council. The magnitude of effect on this area is subject to the design of the scheme and the land take required to accommodate the footprint of the rail station, associated infrastructure and access routes.

The woodland habitat and surrounding fields provide good foraging and potential roosting habitat for bats, and potentially other protected species such as badgers. Breeding birds may also be impacted should works be undertaken within the breeding season.

## 5.5.5.2 Mitigation

Mitigation measures noted within this section are generic measures that can be applied to all Options where relevant actions discussed are anticipated to be required as part of the construction or operation of the intervention(s) within the Option.

- Removal of trees and hedges should be avoided if possible during the breeding bird season (March-September inclusive) and only undertaken after they have been checked for nesting birds. The pre-removal check should be carried out by a qualified and experienced Ecologist.
- A tree and bat survey should be carried out by a licensed bat worker before the removal of any mature trees. If bats are found a licence should be obtained from Scottish Natural Heritage (SNH) before any works commence.

- Where possible, if lighting is required on site, this should be directional. Lighting columns should be avoided wherever
  possible to prevent disturbance to bats.
- Measures to prevent pollution of watercourses should be implemented prior to and during construction to avoid any potential impacts on aquatic ecology or protected species in use of the resources.
- Wherever wildlife habitats remain alongside working areas, provision would be made to prevent encroachment onto valuable ecological areas that are not essentially required for construction. This would include the provision of secure fencing where appropriate.
- Where habitat areas are lost permanently to the footprint of new development, consideration should be given to offsetting these impacts by recreating or enhancing habitats elsewhere, or limiting the effects by reinstating as much habitat as possible following completion of construction activities.

# 5.5.5.3 Summary

Table 5.5 highlights the overall assessment of impacts on biodiversity and habitats from the development of the Options. The assessment assumes that good construction practices will be followed where development is required, and that appropriate mitigation measures are incorporated within the final design. In the absence of survey data, these impacts are based on professional judgement only.

Option	Magnitude of Temporary Impacts	Magnitude of Permanent Impacts
Option 1	Minor Negative	Neutral
Option 2	Neutral	Negligible
Option 3	Neutral	Negligible (positive)
Option 4	Minor Negative	Negligible
Option 5	Minor Negative	Negligible
Option 6	Neutral	Neutral
Option 7	Minor Negative	Negligible
Option 8	Minor Negative	Negligible
Option 9	Minor Negative	Negligible

## Table 5.5: Biodiversity and Habitat Impact Summary

## 5.5.6 Landscape and Visual Amenity

#### 5.5.6.1 Introduction

Transport related developments can, as a result of the physical infrastructure associated with them, have a major impact on landscape. Impacts such as the removal of boundaries or vegetation or the introduction of foreign materials can affect specific components of the landscape which are fundamental to landscape or townscape character.

The landscape appraisal of the Options has involved a review of published documentation (including development plans, Ordnance Survey mapping, aerial imagery and data on conservation interests in the study area). A review of the SNH Landscape Character Assessments for Glasgow and the Clyde Valley has also been undertaken with particular consideration given to the landscape areas and types within study area.

46

The main criteria used to evaluate the potential impact on landscape character comprise the following:

- The extent to which existing landscape components and features would be lost or modified by the proposals (such as lost woodland or modified landform);
- The existence of the proposed form of development within the landscape and its current role as a determinant of existing character; and
- The extent to which new or additional development of the type proposed would alter the balance and hence perception of the landscape character of the area development.

Impacts can be detrimental where features or key characteristics such as established planting, old buildings or structures have to be removed. Alternatively it can prove beneficial where derelict buildings or poorly maintained landscape features are repaired, replaced and maintained or there is the introduction of new tree planting and a landscape structure where none currently exists.

## Option 1: Do Minimum

There are not likely to be any significant impacts on the landscape or visual amenity from the Do Minimum scenario. Any projects developed within this Option likely to result in any adverse landscape or visual effects are presumed to incorporate adequate mitigation to avoid or reduce these effects.

## Option 2: A803 Quality Bus Corridor Package

A modal shift from private vehicles to buses will have no impact on the surrounding landscape or visual amenity.

## Option 3: Bus Hub in Kirkintilloch

It is not likely that a centralised bus hub will result in any impacts on landscape or visual amenity. However the Kirkintilloch town centre Conservation Area will have to be considered in the design of the scheme to ensure it is in keeping with its surroundings. It is likely that this can be mitigated during design of the Option.

## Option 4: Bus Park & Ride in the vicinity of B757 / KLR

The introduction of a new structure within the landscape has the potential to result in adverse effects on the landscape and visual amenity of the area. Of the two sites proposed for the scheme, the Woodilee site is within/ immediately adjacent to the south Lenzie Conservation Area and Townscape Area. This is also surrounded by residential areas and a long-distance pathway and Core Path along the Bothlin Burn. Depending on the scale, location and design of Park & Ride at this location there may be significant adverse effects.

The B757 site is also located within close proximity to the south Lenzie Conservation Area and Townscape Area, however is located in an area adjacent to fields and Lenzie Golf Course. Depending on the scale, design and final location of a Park & Ride in this area, there may be significant adverse effects on visual amenity due to the development breaking existing landscape.

## Option 5: Bus Park & Ride adjacent to BRR

Development of a Park & Ride scheme at this location will result in the loss of agricultural land, and potentially some woodland areas. There may be effects on visual amenity however these are dependent on the location and design of the scheme although lighting is likely to be required resulting in potential impacts from lighting/ light spillage. Given the development of Westerhill Business Park and the BRR to the west of this location, the Park & Ride would be mostly in keeping with the surrounding area.

It is likely that other potentially adverse views of the development could be screened.

#### 47

# Option 6: Kirkintilloch / Lenzie Loop Bus

Changes to service patterns on existing sections of the road network are unlikely to have any impacts on the landscape or visual amenity.

## Option 7: Increase parking Provision at Lenzie Rail Station

The existing rail station is located within the south Lenzie Conservation Area and Townscape Area, and is surrounded by residential areas and the Lenzie Moss LNR and Core Path. Depending on the scale, location and design of parking at this location there may be significant adverse effects on the landscape or visual amenity.

# Option 8: Develop a New Rail Station at Woodilee (with Park & Ride)

The area to the immediate south of this site is currently being developed for housing. To accommodate the rail station there will likely be the requirement to remove trees currently screening the railway track to the south, and there may also be wider impacts on visual amenity depending on the final scale of the scheme. The south Lenzie Conservation Area and Townscape Area and a long-distance pathway and Core Path along the Bothlin Burn are also within close proximity to this proposed location.

There are potentially significant visual impacts as a result of a rail station within this area.

# Option 9: Develop a New Rail Station at Westerhill (with Park & Ride)

Development of a rail station at this location will result in the loss of agricultural land, and potentially some woodland areas. There may be effects on visual amenity however these are dependent on the location and design of the scheme. Given the development of Westerhill Business Park and the BRR to the west of this location, the new station would be mostly in keeping with the surround area.

It is likely that other potentially adverse views of the development could be screened.

## 5.5.6.2 Mitigation

Mitigation measures provided within this section are general and can be applied to any Option where new infrastructure is required to be developed. The scale and nature of mitigation required is dependent upon the scale and type of infrastructure proposed. Mitigation measures, typically planting or landform, could minimise potentially detrimental impacts or improve the landscape composition of the area.

During construction of new transport infrastructure, fencing around the perimeter of construction sites can reduce the negative impacts on landscape.

In the long-term, soft landscaping such planting of trees, bushes and long grasses should be used to reduce the visual prominence of structures such as the rail stations and Park & Ride schemes. Landscaping will to some extent reduce the negative impacts on landscape quality however, it will not compensate for the loss of the amenity land.

## 5.5.6.3 Summary

Table 5.6 highlights the overall assessment of impacts on landscape and visual amenity from the development of the Options. The assessment assumes that good construction practices will be followed where development is required, and that appropriate mitigation measures are incorporated within the final design. In the absence survey data, these impacts are based on professional judgement only.

## Table 5.6: Landscape and Visual Amenity Impact Summary

Option	Magnitude of Temporary Impacts	Magnitude of Permanent Impacts
--------	--------------------------------	--------------------------------

Option 1	Negligible	Negligible	
Option 2	Neutral	Neutral	
Option 3	Minor Negative	Minor Negative	
Option 4	Moderate Negative	Moderate Negative	
Option 5	Minor Negative	Negligible	
Option 6	Neutral	Neutral	
Option 7	Minor Negative	Minor Negative	
Option 8	Moderate Negative	Minor Negative	
Option 9	Minor Negative	Negligible	

# 5.5.7 Agriculture and Soils

## 5.5.7.1 Introduction

This assessment considers the effect of the proposed Options on agricultural land, soil and contaminated land. Baseline information was obtained by means of a desk study review of designated areas, land classification maps and aerial photography.

## Agricultural Land Quality

Agricultural land is classified using the Land Capability Classification for Agriculture (LCA) produced by the Macaulay Land Use Research Institute (MLURI). This classification integrates soils data with both climate and topographical knowledge to assign land into classes for their suitability for various agricultural crops and management practices. There are 7 classes some of which are subdivided, where classes 1, 2 and 3 are regarded as the best and most versatile and are collectively termed prime quality land.

## **Designated Agricultural Areas**

Agricultural land is not generally formally protected under a specific designation; however, it is included within other national or local designations. These include: Environmentally Sensitive Areas (ESAs), a national designation, which are areas of special landscape, wildlife or historic interest which can be protected or enhanced by supporting specific agricultural practices. These areas are not necessarily areas of particularly good quality agricultural land. Greenbelt and Countryside Areas are local policy areas that relate to open land in the rural areas which may be either cultivated or uncultivated.

# Soils

The loss of valuable agricultural soil during construction can occur even if it is kept stored and reinstated; as it is liable to degradation in quality. It is also typical for soils to take a number of years to restore their structure after being reinstated. However appropriate storage methods and the establishment of suitable crops and additional drainage once reinstated can help the process.

## Contaminated Land

Although contaminated land is primarily an engineering consideration for any development, the construction process in particular can provide a pathway for contaminants leading to potential effects on the environment and/or human health.

## **Option 1: Do Minimum**

Greatest impacts on agriculture and soils from the development of the Do Minimum are from land-take to accommodate the BRR. However given this has been commissioned the impacts from this are not likely to be significant.

# Option 2: A803 Quality Bus Corridor Package

There is not anticipated to be any impact on agriculture or soils associated with the development of this option.

#### Option 3: Bus Hub in Kirkintilloch

The development of this Option will be within an urban area. Any land required to accommodate the development of this will not impact on agricultural land.

#### Option 4: Bus Park & Ride in the vicinity of B757 / KLR

Of the two proposed locations, the location adjacent to the B757 would likely require land-take from current agricultural use. The extent of this area is dependent upon the final location and the scale of the Park & Ride scheme. The agricultural land surrounding this area is regarding as being of Class 3.2 – capable of supporting 'mixed agriculture'.

#### Option 5: Bus Park & Ride adjacent to BRR

This Option is proposed in an area that predominantly utilised for agricultural purposes. This land is regarded as being of Class 3.2 – capable of supporting 'mixed agriculture'.

It is likely that land take from current agricultural use would be required in order to accommodate the Park & Ride scheme and its associated infrastructure. The extent of this area and therefore the magnitude of impact is dependent upon the final location and the scale of the Park & Ride scheme.

#### Option 6: Kirkintilloch / Lenzie Loop Bus

Changes to service patterns on existing sections of the road network will not impact agriculture or soils.

#### Option 7: Increase parking Provision at Lenzie Rail Station

The existing rail station is located within an urban area and impacts on agriculture are not likely to result from the development of this Option.

#### Option 8: Develop a New Rail Station at Woodilee (with Park & Ride)

The area south of the rail tracks is utilised for agriculture. Potential impacts from land-take or potential contamination of soils is dependent on the final location and scale of rail station and associated Park & Ride infrastructure.

#### Option 9: Develop a New Rail Station at Westerhill (with Park & Ride)

This Option is proposed in an area that is predominantly utilised for agricultural purposes. This land is regarded as being of Class 3.2 – capable of supporting 'mixed agriculture'.

It is likely that land take from current agricultural use would be required in order to accommodate the rail station and associated Park & Ride scheme. The extent of this area and therefore the magnitude of impact is dependent upon the final location and the scale of the Option.

## 5.5.7.2 Mitigation

Where agricultural land is affected by construction activities, mitigation will involve:

- Taking due care during construction;
- Maintenance of access;

- Repair and replacement of agricultural drains; and
- Where applicable, reinstatement of agricultural fields to enable continued farming practices to be carried out correctly.

Mitigation to prevent impacts on soils would include ensuring that soils are adequately protected and/or temporarily removed during construction works, then restored/replaced after construction works have been completed.

Compensation has been assumed for areas of permanent agricultural land loss as well as agricultural land which may no longer be viable for farming use due to severance.

#### 5.5.7.3 Summary

Table 5.7 highlights the overall assessment of impacts on agriculture and soils from the development of the Options. The assessment assumes that good construction practices will be followed where development is required, and that appropriate mitigation measures are incorporated within the final design. In the absence of survey data, these impacts are based on professional judgement only.

Option	Magnitude of Temporary Impacts	Magnitude of Permanent Impacts		
Option 1	Minor Negative	Negligible		
Option 2	Negligible	Neutral		
Option 3	Neutral	Neutral		
Option 4	Minor Negative	Minor Negative		
Option 5	Minor Negative	Minor Negative		
Option 6	Neutral	Neutral		
Option 7	Neutral	Neutral		
Option 8	Minor Negative	Minor Negative		
Option 9	Minor Negative	Minor Negative		

#### Table 5.7: Agriculture and Soils Impact Summary

## 5.5.8 Cultural Heritage

# 5.5.8.1 Introduction

Cultural heritage encompasses elements of the built environment such as historic buildings and monuments and known/unknown archaeology. Transport schemes can result in direct and indirect impacts on cultural heritage interests including physical impacts to buildings or archaeological sites or impacts on the setting of historic buildings or monuments.

This assessment has been informed by a desk study only. The presence of cultural heritage designations including listed buildings, scheduled ancient monuments and conservation areas has been confirmed by a review of Historic Scotland data and East Dunbartonshire Council's Local Development Plan 2.

The key considerations with respect to the Options are:

• **Potential increase/decrease in traffic flows** - The noise and vibration generated by vehicles can cause physical damage to historic buildings and monuments.

51

• **Impacts on setting** - Historic buildings and monuments as well as conservation areas are vulnerable to improper development. Modern developments can impact on their wider setting and affect the historical context and value of a building or area.

• **Potential loss of unknown archaeology** - Physical developments may result in the loss of previously unrecorded archaeological interests. Buried items may be damaged or lost as a result of construction activities associated with, for example, the development of the Park & Ride facilities and new rail stations. This would also apply in relation to increased parking at Lenzie if this was progressed with a view on developing on additional ground adjacent to the existing facilities.

There are a large number of cultural and archaeological importance within the study area, including the Antonine Wall World Heritage Site (WHS) and its buffer zone, the Forth and Clyde Canal Scheduled Ancient Monument (SAM), the Lenzie, south Lenzie and Kirkintilloch Conservation Areas and Kirkintilloch Townscape Protection Area, and numerous listed buildings located throughout the study area.

## Option 1: Do Minimum

The implementation of the Do Minimum Option is not likely to result in any significant impacts on cultural heritage. Where potential impacts may occur are as a result of the construction of the BRR which may uncover previously unknown archaeological assets. Works within Kirkintilloch town centre will also be undertaken within close proximity to a number of sensitive cultural heritage sites, such as the Antonine Wall WHS and its buffer zone, the Forth and Clyde Canal SAM, the Kirkintilloch Conservation Area and Townscape Protection Area, and numerous listed buildings. These sites may be impacted through physical damage from vibration during the construction / and or operation of the schemes within this Option.

These potential effects will have been mitigated for in the proposals for the BRR. Potential effects on cultural heritage are Minor Negative.

## Option 2: A803 Quality Bus Corridor Package

The creation of a quality bus corridor on this route is not likely to result in any impacts on cultural heritage assets. However it should be noted that there are three listed buildings along the route: it passes both the Coltpark Avenue/Stuart Drive and Balmuildy/Kirkintilloch Road Conservation Areas within Bishopbriggs and the northern section of the route is located within the Antonine Wall WHS buffer zone. Careful consideration of each of these assets will be required when designing the scheme.

## Option 3: Bus Hub in Kirkintilloch

The Kirkintilloch town centre is a culturally sensitive area, bounded to the north by the Antonine Wall WHS and to the south by the Forth and Clyde Canal SAM. The centre itself is a Conservation Area and Townscape Protection Area with a high density of listed buildings including the Category A listed St Mary old parish church.

Provided that the design of any new infrastructure is in keeping with the Conservation and Townscape Area, it is likely that impacts on cultural assets will be during construction, with increased vibration from heavy plant operating and potential accidents/ damage to buildings when accessing site. The magnitude of these effects are dependent upon the final design of the scheme and its location in relation to cultural assets.

## Option 4: Bus Park & Ride in the vicinity of B757 / KLR

The cultural assets that may be impacted upon from the development of this Option is dependent upon its location. The location adjacent to the KLR is within the Lenzie Conservation Area, and immediately adjacent to an area of woodland within the Ancient Woodland Inventory. The site adjacent to the B757 is on the edge of the south Lenzie Conservation Area. Impacts on these receptors are dependent upon the final design and scale of the Park & Ride scheme.

There remains the potential that there are unknown archaeological assets located at these locations. Prior to any development, an archaeological survey will be required to ensure no other assets are present that may be impacted from the development.

## Option 5: Bus Park & Ride adjacent to BRR

The only known cultural heritage asset within the near vicinity of the proposed site is the Category C listed building at Cadder Yard. The impact on this building is dependent upon the final location and design of the Option.

There remains the potential that there are unknown archaeological assets located at this location. Prior to any development, an archaeological survey will be required to ensure no other assets are present that may be impacted from the development.

## Option 6: Kirkintilloch / Lenzie Loop Bus

Changes to service patterns on existing sections of the road network are not likely to result in any impacts on cultural heritage.

#### Option 7: Increase parking Provision at Lenzie Rail Station

The rail station is a listed building, and lies within the Lenzie and south Lenzie Conservation Area. There are also a number of other listed buildings located within the Conservation Areas.

The impacts on the Conservation Areas and the listed buildings within it are dependent on the type of proposal chosen to increase the parking at the station, and also its design. However it is likely that there will be adverse effects either directly during construction and/or permanently on the setting of these features and the area.

## Option 8: Develop a New Rail Station at Woodilee (with Park & Ride)

The proposed site is located within close proximity to a Category B listed building. Other features within the surrounding area include an area of woodland listed within the AWI and also the Lenzie Conservation Area to the east. These may be either directly or indirectly impacted upon during the construction and operation of this Option, however the magnitude of these effects is dependent upon the location and scale of the rail station and Park & Ride scheme.

There remains the potential that there are unknown archaeological assets located at this location. Prior to any development, an archaeological survey will be required to ensure no other assets are present that may be impacted from the development.

## Option 9: Develop a New Rail Station at Westerhill (with Park & Ride)

The only known cultural heritage asset within the near vicinity of the proposed site is the Category C listed building at Cadder Yard. The impact on this building is dependent upon the final location and design of the Option.

There remains the potential that there are unknown archaeological assets located at this location. Prior to any development, an archaeological survey will be required to ensure no other assets are present that may be impacted from the development.

#### 5.5.8.2 Mitigation

All new infrastructure developed should be designed such that it is integrated with the existing heritage character and do not impact on the setting of any listed buildings.

The development of any infrastructure within amenity land/ open ground should have an archaeological survey undertaken prior to works commencing to determine the potential presence of any unknown archaeological assets.

## 5.5.8.3 Summary

Table 5.8 highlights the overall assessment of impacts on archaeology and cultural heritage from the development of the Options. The assessment assumes that good construction practices will be followed where development is required, and that appropriate mitigation measures are incorporated within the final design. In the absence of survey data, these impacts are based on professional judgement only.

Option	Magnitude of Temporary Impacts	Magnitude of Permanent Impacts		
Option 1	Minor Negative	Negligible		
Option 2	Negligible	Neutral		
Option 3	Moderate Negative	Minor Negative		
Option 4	Minor Negative	Minor Negative		
Option 5	Minor Negative	Negligible		
Option 6	Neutral	Neutral		
Option 7	Moderate Negative	Moderate Negative		
Option 8	Minor Negative	Minor Negative		
Option 9	Minor Negative	Negligible		

#### **Table 5.8: Cultural Heritage Impact Summary**

#### 5.6 Safety

The following Sections discuss the impacts of the proposals on the two safety sub-objectives: Accidents and Security.

# 5.6.1 Accidents

In line with STAG, a qualitative assessment of the impact of different options on accident levels and users likely to be affected has been undertaken.

In the Do Minimum case, danger to pedestrians, cyclists and other drivers is mitigated through improved road signage and through general improvements for walking and cycling, for example through implementation of the Kirkintilloch Town Centre Regeneration Strategy and other committed Council strategies. The Do Minimum case also increases safety by reducing queuing traffic through the implementation of schemes such as the BRR.

It is considered that each of the Options, through the promotion of public transport, will increase levels of safety to varying degrees as follows:

A803 Quality Bus Corridor Package (Option 2)

The introduction of Quality Bus measures would potentially smooth out traffic flow and reduce link speeds, which is expected to have a beneficial impact on Personal Injury Accidents. In addition, this Option could possibly reduce the number of road casualties by removing cars from the road network, but this effect will depend on the degree of modal shift generated from private modes. It is anticipated that this Option would have a minor positive impact on safety.

• Bus Hub in Kirkintilloch (Option 3)

The integration of bus stops associated with this measure would reduce the incidence of traffic congestion through Kirkintilloch town centre to a small degree. It is not expected that this Option would notably increase the mode share for public transport, and thus this Option is expected to have an overall neutral effect on Personal Injury Accidents.

• Bus-Based Options (Option 4, 5 and 6)

These Options are anticipated to have a neutral impact on safety: the Options could possibly reduce the number of road casualties by removing cars from the road network, but this effect will depend on the degree of modal shift generated from private modes.

• Increased Parking Provision at Lenzie Station (Option 7)

This Option is expected to remove cars from the road network by encouraging modal shift from car to rail. However it may generate more local traffic in populated areas, thus increasing the risk of pedestrian casualties, and is therefore expected to have an overall neutral impact on Personal Injury Accidents.

• New Rail Stations (Options 8 and 9)

These Options may transfer some trips by car to a safer mode, rail, thus having a minor positive benefit.

In terms of change to the balance of severity of accidents associated with each Option, it is expected that Options which result in a smoother flow of traffic (through modal shift from private car) would see a reduction in link speeds which should in turn result in a reduction in the severity of accidents. It is anticipated that Options 2, 8 and 9 would have a minor positive impact in this regard. All other Options are expected to have a neutral impact, with the exception of Option 7 whereby the increase in parking provision at Lenzie Rail Station may generate more local traffic in populated areas.

## 5.6.1.1 Accident Costs

Analysis has also been undertaken in line with relevant STAG Guidance (Section 8 Safety) to quantify the impacts of each intervention in terms of changes in accident levels and severity against the Do Minimum scenario. This is undertaken by relating levels of traffic on the road (measured by vehicle kilometres) to the number of accidents via the application of an accident rate.

Changes in highway kilometres have been taken from the option modelling using CSTM and applied against standard accident and cost rates from NESA. Accident costs associated with each option against the Do Minimum scenario is presented in Table 5.9. It is to be noted it has not been possible to assess Option 3 (Kirkintilloch Bus Hub) due to the localised nature of this option.

		Options compared to Do Minimum						
Annual Numbers of		Option 2	Option 4	Option 5	Option 6	Option 7	Option 8	Option 9
Fatal	22.40	0.00	-0.01	-0.01	0.00	0.00	0.00	-0.01
Serious	223.85	0.01	-0.06	-0.06	0.00	0.00	-0.03	-0.07
Slight	2,655.13	0.05	-0.73	-0.76	-0.02	0.00	-0.39	-0.80
Damage only	30,464.67	0.91	-8.18	-8.72	0.18	0.00	-4.42	-9.09
Total Cost [£]	218,047,470	5,160	-60,428	-62,140	-2,758	-10	-32,600	-65,508

#### Table 5.9: Assessment of Security Sub-Criterion

Table 5.9 indicates that on the whole, over a 60 year appraisal period, each of the options are anticipated to have a negligible impact on accident costs. With the exception of Option 2 (QBC) which appears to result in a very small increase in the number of damage only accidents, each of the options are anticipated to improve safety and reduce accident costs. The greatest benefits appear to be related to the development of the bus-based Park & Ride sites (Options 4 and 5) and new rail stations (Options 8 and 9), although overall impacts are negligible.

Against the Reference Case (i.e. with Robroyston Station), total accident costs are marginally lower than in the Do-Minimum Scenario. However, again the impact of each option against the Reference Case remains negligible and it is not anticipated that in quantitative terms, any of the options will have a significant impact in improving or otherwise the level and severity of accidents in the study area.

# 5.6.2 Security

It is considered that Security is of particular relevance in relation to the development of public transport measures, including the promotion of walking and cycling, promotion of public transport, bus priority, and the development of Park & Ride facilities and new rail stations. These facilities require to incorporate good design to mitigate feelings of insecurity.

Collaboration with private business and/or community groups can help to provide a 'human presence' within or around public transport facilities. Un-staffed stops should be constructed to take account of passenger safety and security. Elements incorporated into the design can include lighting, CCTV and open areas, where waiting passengers are visible from neighbouring roads or streets.

Park & Ride facilities should be designed in accordance with current good practice and standards to ensure that all aspects of passenger safety are allowed for wherever possible. Similarly, on-board public transport it is possible to design a safe and secure environment.

Feedback from stakeholder consultations indicated that security is a key factor in encouraging the use of public transport, and the requirement for a safe and secure environment both on-board public transport services, and within waiting and parking areas, particularly for those who may be travelling during quieter periods for example late in the evening, was noted.

In summary, it is considered that the personal security concerns of many individuals when using public transport, walking and cycling can be largely dealt with in the provision of mitigating facilities designed into the scheme development, such that all Options would achieve a positive impact in this regard. Further details are set out within Table 5.10: it should be noted that not all mitigating facilities will be relevant to all Options.

Security Indicator	Relative importance (High/ Medium/ Low)	Vulnerable groups of Society affected	Without strategy (Poor/ Moderate/ High)	With strategy (Poor/ Moderate/ High)
Site perimeters, entrances and exits	High	Children, elderly, women travelling alone.	Poor	Moderate / High: Clearly marked site perimeters/exits. Use of open fencing rather than solid walls.
Formal surveillance	High	Children, elderly, women travelling alone.	Poor	Moderate / High: Effective CCTV system in place. Design to encourage staff surveillance and group passengers.
Informal surveillance	High	Children, elderly, women travelling alone.	Poor	Moderate / High: Positive use of materials (fencing etc.) and design to encourage open visibility from site surrounds. Encouragement or proximity of retailers or other activity.
Landscaping	High	Children, elderly, women travelling	Poor	Moderate / High: Positive use of landscaping features (design, plants etc.) to contribute to visibility and

## Table 5.10: Assessment of Security Sub-Criterion

		alone.		deter intruders.
Lighting and visibility	High	Children, elderly, women travelling alone.	Poor	Moderate / High: Good design to avoid recesses and facilitate camera/monitor view. Lighting to daylight standard in passenger areas when facility open. Attention to lighting on signing, information and help points.
Emergency call	High	Children, elderly, women travelling alone.	Poor	Moderate / High: Good provision of emergency phones, help points, public telephones and information on emergency help procedure.

5.6.3 Summary Table 5.11 provides a summary of the performance of each Option against the STAG Safety criteria.

# Table 5.11: Performance against STAG Criteria: Safety

### 5.7 Economy

#### 5.7.1 Introduction

Within STAG, the Economy Criterion has three sub-criteria for assessment:

- Transport Economic Efficiency (TEE) covers the benefits ordinarily captured by standard cost-benefit analysis the transport impacts of an option.
- Wider Economic Benefits (WEBs) relate to the notion of potential transport impacts on agglomeration and the relationship between agglomeration and productivity; and
- Economic Activity and Location Impacts (EALIs) allow the impact of an option to be expressed in terms of the net effects of the option on the local and/or national economy.

It is to be noted that analysis presented in this study is based on an assessment of TEE and EALI, and no study of WEBS has been undertaken.

## 5.7.2 CSTM Modelling Analysis

Options have been assessed using Transport Scotland's Central Scotland Transport Model (CSTM12). Adopting a common modelling platform to assess the options provides consistent results enabling direct comparisons to be made. CSTM12 was considered to be the most fit for purpose tool available for the purposes of this study given the inclusion of the proposals for new rail stations at Woodilee (Option 8) and Westerhill (Option 9) and the need to assess the likely impacts of these options on the wider transport network across Central Scotland. However, there are a number of limitations associated with the model including that the scale of some of the options are relatively small in comparison to the overall modelled area. Nevertheless the results provide a reasonable indication of the relative attractiveness of the options. Should a preferred Option(s) be taken forward for further consideration, additional modelling will be required.

Each of the options under consideration as part of this Route Corridor Study have been modelled, with and without the Robroyston Park & Ride (the Reference Case). The exception to this is Option 3 (Kirkintilloch Bus Hub) and Option 6 (Kirkintilloch/Lenzie Loop Bus) which cannot be assessed using CSTM12.

#### 5.7.3 Demand Analysis

Based on the model output, analysis has been undertaken of car (highway) and passenger (public transport) matrix totals, and estimated annual boarding and alighting passenger numbers at stations, compared to the relevant Do-Minimum and Reference Case. On the whole, changes in total car and public transport numbers (i.e. as a comparison between the Do-Minimum scenario and each of the options tested) are relatively negligible and this is because these are representative of changes across the whole modelled area covered by CSTM. This does not mean however that there are not local changes in travel distribution and it has been possible to draw out some broad observations from the results of the CSTM as presented in the follow sections.

#### Option 1: Do Minimum

The Do Minimum sets the baseline against which other options are compared. One observation to be noted is that CSTM12
appears to significantly underestimate the number of users at rail stations across in the study area (i.e. when compared to
published ORR station usage figures). This underestimation applies across all option tests.

### Option 2: A803 Quality Bus Corridor Package

• Changes in car matrix totals in a scenario with Option 2 in place are negligible.

- Changes in public transport totals in a scenario with Option 2 in place are negligible.
- Changes in station usage figures indicate that under a scenario with Option 2 in place, usage at Bishopbriggs Station drops by 5% and at Lenzie station by 4%, which could be related to the availability of a more attractive bus link on the A803 as assumed under this option.

### Option 4: Bus Park & Ride in the vicinity of B757 / KLR

- Changes in car matrix totals in a scenario with Option 4 in place are negligible.
- Changes in public transport totals in a scenario with Option 4 in place are negligible.
- Changes in station usage figures indicate that under a scenario with Option 4 in place, usage at Bishopbriggs Station
  remains the same while Lenzie shows a marginal reduction in passenger figures which may possibly be related to a transfer
  of trips from Lenzie rail station to a new Park & Ride on the outskirts of the village.
- A new Park & Ride in this location is estimated to generate annual patronage in the region of 46,000 (around 100 passengers during the AM peak period).

#### Option 5: Bus Park & Ride adjacent to BRR

- Changes in car matrix totals in a scenario with Option 5 in place are negligible.
- Changes in public transport totals in a scenario with Option 5 in place are negligible.
- Changes in station usage figures indicate that under a scenario with Option 5 in place, passenger numbers at Bishopbriggs and Lenzie Station drop slightly which may be due to the transfer of trips to the Park & Ride option.
- A new Park & Ride in this location is estimated to generate annual patronage in the region of 39,000 (around 120 passengers during the AM peak period).

#### Option 7: Increase Parking Provision at Lenzie Rail Station

- Changes in car matrix totals in a scenario with Option 7 in place are negligible.
- Changes in public transport totals in a scenario with Option 7 in place are negligible.
- Changes in station usage figures in a scenario with Option 7 in place are negligible.

#### Option 8: Develop a New Rail Station at Woodilee (with Park & Ride)

- Changes in car matrix totals in a scenario with Option 8 in place are negligible.
- Changes in public transport totals in a scenario with Option 8 in place are negligible.
- Changes in station usage figures indicate that with a new Woodilee Station, there would be a negligible impact on passenger numbers at Bishopbriggs and a very slight reduction in passenger numbers at Lenzie rail station.
- A new station at Woodilee is estimated to generate annual patronage in the region of 21,000 (approximately 50 passengers in the AM peak period).

# Option 9: Develop a New Rail Station at Westerhill (with Park & Ride)

- Changes in car matrix totals in a scenario with Option 8 in place are negligible.
- Changes in public transport totals in a scenario with Option 8 in place are negligible.
- Changes in station usage figures indicate that with a new Westerhill Station there would be a negligible impact on passenger numbers at Bishopbriggs and Lenzie rail stations.
- A new station at Westerhill is estimated to generate annual patronage in the region of 51,000 (approximately 100 passengers in the AM peak period).

### 5.7.4 Transport Economic Efficiency (TEE)

The economic appraisal of the various options has been undertaken using the software Transport User Benefit Appraisal (TUBA – version 1.9.5). TUBA uses a 60 year appraisal period to assess scheme costs and benefits. All of the options have been assessed for a 60 year appraisal period starting in the scheme opening year.

Tables 5.12 and 5.13 present a summary of the overall TEE outputs comparing the economic performance of options against Do-Minimum and Reference Case scenario's respectively. This is followed by analysis of individual option performance.

# Table 5.12: TEE Summary for Options vs Do-Minimum

### Option 1: Do Minimum

• The Do Minimum sets the baseline against which other options are compared.

#### Option 2: A803 Quality Bus Corridor Package

- The primary source of benefits derived under this option is travel time savings. This benefit is primarily borne by public transport users who will benefit from improved bus journey times.
- However, albeit lower, a level of benefit is also anticipated amongst road users who will benefit through a transfer of trips to bus, which it is assumed will result in a level of reduction on the surrounding road network, contributing to travel time savings. From detailed analysis, the majority of benefits are for commuters as opposed to business.
- Overall, based on the results of modelling, this option is estimated to deliver a strong positive BCR. Care should be taken when assessing BCR due to previously discussed modelling limitations.
- Under the reference scenario, this option performs similarly, with a marginal increase in benefits derived, potentially linked to additional journey time benefits on the road network due to the transfer of trips to the proposed Robroyston Park & Ride.

#### Option 4: Bus Park & Ride in the vicinity of B757 / KLR

- Analysis indicates that the main benefits generated under this option are travel time savings. Road users, as opposed to
  public transport users, are the key benefactors of this option. It is considered that this is because the transfer of trips to the
  Park & Ride assumed under this option results in reduced levels of congestion/traffic queuing within the study area,
  therefore delivering benefits in the form of travel time savings and reduced vehicle operating costs.
- Conversely, there is limited benefit for public transport users in monetised terms. For example, this option assumes that while there would be more people using public transport at the Park & Ride at a local level, there is no reduction in public transport time, rather just the provision of a service. There would also be user charges associated with using the Park & Ride which would have a cost implication for public transport users.
- Overall, based on the results of modelling, this option is estimated to deliver a strong positive BCR.
- However under the reference case scenario with Robroyston Park & Ride station in place, the option performs very
  differently and is estimated to generate a negative BCR. This is because in a situation with Robroyston station in place,
  there is not the same level of trips transferring to the proposed new Park & Ride at the B757/KLR (i.e. there is not the same
  level of abstraction of highway trips off the network as the modelling predicts that these will already have been taken by
  Robroyston). In other words, under the reference case scenario, the generated benefits are attributed to the Robroyston
  station proposal, possibly due to its accessible location from the motorway network.

#### Option 5: Bus Park & Ride adjacent to BRR

- Analysis of the modelling results shows that Option 5 performs very similarly to Option 4 with the main benefits derived for highway users. The level of benefit is also relatively consistent to that of Option 4, which suggests that the Park & Ride options have been modelled similarly.
- Overall, this option is estimated to deliver a positive BCR. Assuming that the Park & Ride would be served by existing bus services, this option generates a slightly higher BCR than Option 4. However, if it is to be assumed that there would be additional operating costs associated with providing and operating new bus services under this Option, a lower positive BCR than Option 4 is anticipated.

Similar to Option 4, in a scenario with Robroyston Park & Ride in place (the reference case), the option does not perform
favourably and is estimated to generate a negative BCR with benefits previously generated abstracted by the availability of
the proposed Robroyston Park & Ride.

### Option 7: Increase Parking Provision at Lenzie Rail Station

- On the whole, this option appears to have limited impact in terms of generating benefits. Although additional parking is provided, as shown by the demand analysis there appears to be little change in demand or travel distribution locally. As such, little benefit is generated.
- Instead, additional costs are generated associated with a reduction in public transport revenues associated with an increase in parking availability at Lenzie station. On the whole, it is considered that this scheme is too small to be realistically assessed by the strategic model and due to the scale of benefits, it is difficult to draw any clear conclusions.
- Under the reference case scenario, marginally higher benefits are generated. Benefits are primarily generated by
  improvements in travel time for public transport users (potentially due to a greater opportunity to travel by rail at Lenzie in a
  situation where additional parking is provided and a new station at Robroyston is in place). However, overall the impact is
  negligible and this option is still estimated to generate a BCR lower than 1.

### Option 8: Develop a New Rail Station at Woodilee (with Park & Ride)

- Analysis of the TEE outputs indicates that the major benefits derived with this option is travel time savings for road users, which it is assumed is associated with a reduction in congestion on the local road network due to an increase in public transport users linked to a new rail station at Woodilee.
- There also appears to be some benefit generated for public transport users which is to be anticipated with the provision of new rail station, although this benefit is limited to consumer others and business users as opposed to commuters. Indeed it is to be noted that in comparison to Option 9 (Westerhill Park & Ride discussed below), the level of benefit generated by travel time savings is estimated to be lower overall, and this new station is estimated to have a negative impact on public transport commuter users. One explanation for this higher travel time from Woodilee could be the increased time it could take motorists to access the site. Overall however, as indicated above, travel time savings generate a positive economic impact because of the benefits delivered to car users through reduced traffic levels on the local road network.
- Overall, this option is estimated to deliver a positive BCR under the Do-Minimum scenario.
- However, in a scenario with Robroyston Park & Ride in place (the reference case), the option does not perform favourably
  and is estimated to generate a negative BCR with benefits previously generated abstracted by the availability of the
  proposed Robroyston Park & Ride.

### Option 9: Develop a New Rail Station at Westerhill (with Park & Ride)

- Analysis of the TEE outputs indicates that the primary source of benefits associated with a new rail station at Westerhill is
  travel time savings. Benefits are generated primarily for road users. As per previous, it is estimated that this is due to a
  reduction in local traffic and congestion associated with increased numbers using public transport. However, this option
  also generates benefits for public transport users who will gain from faster travel times associated with the provision of a
  new rail station in this location.
- Overall, this option is estimated to deliver a positive BCR under the Do-Minimum scenario.

65

• Similar to Option 8, in a scenario with the Robroyston Park & Ride proposal in place (the reference case), the option does not perform favourably and is estimated to generate a negative BCR with benefits previously generated abstracted by the availability of the proposed Robroyston Park & Ride.

### 5.7.5 Summary of TUBA Results

As a comparison, the results indicate that the bus based options (Options 2, 4 and 5) are expected to generate greater positive economic benefit cost ratio than the rail based options, primarily as these options are not as costly as the rail options.

The inclusion of a new Park & Ride rail station at Robroyston however has a significant impact on the level of benefits generated by the bus and rail-based Park & Ride schemes (Options 4, 5, 8 and 9). This is because previously generated benefits are abstracted by Robroyston station, as car users are attracted onto public transport at Robroyston. As a result, it is estimated that there would be fewer passengers using the proposed bus and rail-based Park & Ride stations and any passengers of the new stations will be existing public transport users rather than people switching mode. This results in a significant public transport user dis-benefit for these options and is the primary reason for the significant differences between the PVB for these options when compared against the Do Minimum or Reference Case scenario.

The exception to the above is the A803 Quality Bus Corridor Package (Option 2) which does not appear to be impacted by the availability of a new Robroyston station and generates positive impacts in both the Do-Minimum and Reference Case scenarios.

### 5.7.6 Economic Activity and Location Impacts

The STAG Part 2 appraisal requires an assessment of the economic activity and location impacts (EALI) of the Options. This assessment is undertaken at the local or regional level and at the wider Scottish level. The analysis is also intended to identify how impacts will be distributed across geographical locations and at differing spatial levels.

### 5.7.6.1 Option Impacts

The link between transport investment and economic performance has been widely debated, and depends heavily upon local circumstances. Whilst there is a theoretical basis for assuming that transport improvements will lead to improved economic competitiveness, empirical evidence is less clear. At best, it appears that transport investment is one of a number of issues affecting economic performance, but is by no means the most important or critical factor. At worst, there is a risk that improved transport infrastructure may open up the local economy to more competition, and thus cause a net disbenefit to the local economy.

Overall, it is considered that each of the Options may help to support local economic development opportunities on the Kirkintilloch / Lenzie – Bishopbriggs – Glasgow corridor through a contribution of managed congestion brought about by increased accessibility and improved journey times particularly along the A803 corridor.

Option 2, through the implementation of Quality Bus measures, and Options 4 and 5 through the provision of bus-based Park & Ride facilities, may have wider economic impacts through improving public transport and accessibility to Glasgow. Option 5 would also improve public transport accessibility for trips to the study area and specifically the large employers at Westerhill Business Park, promoting further development at the Business Park.

The implementation of a bus hub in Kirkintilloch (Option 3) may have a marginal impact on the economy of Kirkintilloch through reduced congestion and improved accessibility through the town centre attributable to the rationalisation of bus stops.

Option 6 may have wider economic impacts through improving public transport access between Lenzie and Kirkintilloch, however this may be negated if the implementation of a loop bus service opens up the local economy of Kirkintilloch to more competition through improving access to the rail network and associated wider economic centres.

66

The increased parking provision associated with Option 7 may have wider economic benefits through improving public transport and accessibility to Glasgow and other economic centres served by the rail network.

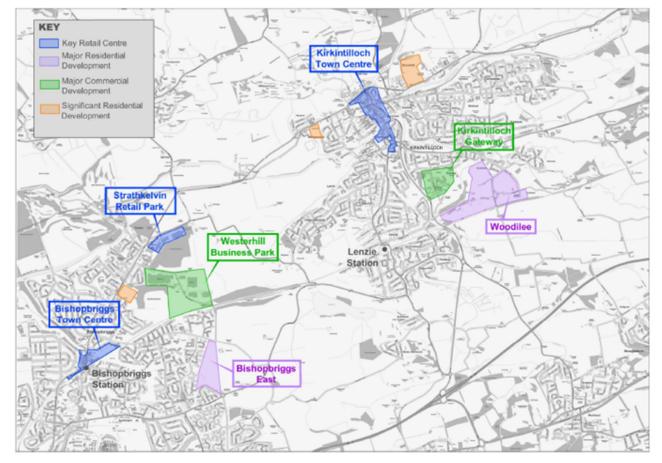

Options 8 and 9, through the implementation of new rail stations, are likely to have the greatest economic impact through improving public transport and accessibility to Glasgow, and other key economic centres located on the Edinburgh – Glasgow and Stirling / Alloa – Glasgow rail line. The development of a new station at Westerhill (Option 9) would also be expected support local development and economic growth in the study area by improving access by rail to Westerhill Business Park.

#### 5.7.6.2 Developments Likely to Benefit from Scheme Options

Although many of the proposed and committed developments within the study area are already planned to proceed, there may be some development areas where the full development potential or realisation, as well as the timing and scale of development, could be influenced by the implementation of the Options.

These developments and areas may comprise:

- Surplus Bishopbriggs Academy site: an opportunity to generate higher levels of town centre visitors; a larger town centre resident population; and improved town centre layout and environment, through the development of a masterplan which may include consideration of new convenience retail floor space; new residential development; centrally located building(s) suitable for community uses; a new central civic area; improved existing public realm; and long-stay parking provision.
- Kirkintilloch: it is the Council's aim to create strong place identity for Kirkintilloch Town Centre, increase visitor and local footfall, and attract higher levels of inward investment. Throughout the town centre this will be achieved through improvements to public realm, access and parking and business support.
- Kirkintilloch Masterplan: In addition to the general approach to improvement, the Local Plan 2 identifies an area to be the subject to a Masterplan: a mixed use, redevelopment for the area bounded to the west by the Kirkintilloch Link Road, to the north by the existing residential area around Loch Road and to the south and east by Woodilee Road. The Masterplan sets a vision for the Kirkintilloch Gateway which is to create a thriving business location with a range of high quality, flexible business units. Reflecting the location of the site, the main focus will be Class 4 and 5 business accommodation, as well as Class 6 warehousing/distribution. Such business accommodation should integrate with the adjacent housing developments.
- Strathkelvin Retail Park: Improving the range and quality of East Dunbartonshire's comparison goods retail offer at Strathkelvin Retail Park will allow East Dunbartonshire to compete more effectively with surrounding areas, including Robroyston, Cumbernauld, Clydebank and Glasgow. The Council will continue to support comparison goods retailing at this location where it has been demonstrated that these cannot be accommodated in, or on the edge of, a town centre. In particular there may be opportunities to incorporate leisure uses in order to enhance its vitality and attractiveness.
- The Strategic Industrial and Business Location at Westerhill, Bishopbriggs: the Local Plan 2 states that this location should continue to be protected and developed for economic growth. The development of ancillary land uses which support the growing business community will also be encouraged.
- Woodilee: A new 800+ housing development potentially comprising retail, nursery and commercial facilities. It is located
  off the A806 Kirkintilloch Link Road, southeast of Kirkintilloch, which links the development with the strategic road
  network.
- Bishopbriggs East A new 200+ housing development which is located near the Glasgow City Council boundary. The BRR passes to the east of this new development site.
- New Housing Development The Local Plan 2 identifies sites across Bishopbriggs, Kirkintilloch and Lenzie for housing development. These sites are estimated to provide at least 380 units, not including the housing units provided by Bishopbriggs East and Woodilee. The sites are scattered throughout the study area.

The location of these development areas, in relation to the study area, is displayed within Figure 5.1.

Figure 5.1 – Key Developments in the Study Area

### 5.7.6.3 Property Related Impacts at Scotland Level

STAG indicates that potential impacts of transport projects should also be examined at the national level. It is considered in qualitative terms that each of the Options studies for the Kirkintilloch / Lenzie – Bishopbriggs - Glasgow corridor will act as a fundamental 'building block' in the continuing competitiveness of East Dunbartonshire, and Glasgow, as strategic investment locations.

### 5.7.6.4 Property Related Impacts at Regeneration Area Level

As identified within STAG 1, the study area is considered to be relatively affluent, with low levels of unemployment and high levels of car ownership, and therefore the proposed Options considered for the corridor will have limited overall impact in terms of providing greater accessibility for the more deprived and social excluded regeneration areas. Despite the relative affluence of

the study area, there is a small pocket of deprivation within Kirkintilloch in a portion of Hillhead (specifically datazones S01001512 and S01001513). This area is among the 5% most deprived areas in Scotland and scores poorly in the indicators of income, employment and health<sup>23</sup>. It is likely that this area would benefit from the increased public transport provision relating to Options 3, 4 and 6. In addition, the provision of complementary public transport, cycling and walking measures will provide a greater choice of transport, and improve local and regional accessibility. Hillhead is an area identified for regeneration under the management of a Community Planning Partnership.

There is a further area of deprivation in Lennoxtown (datazone S01001546) which is also amongst the 10% most deprived areas in Scotland<sup>24</sup>. Lennoxtown is located to the north of the study area and is unlikely to benefit directly from the Options being considered to any great degree due to the distance from the Options; however there may be a small positive benefit to the residents of Lennoxtown in relation to Options 3 and 6.

It is very difficult to provide an estimate as to the degree of benefit for these local regeneration areas, but it will clearly depend upon the extent to which the residents of these small areas are able to access the public transport services to subsequently gain access to new employment opportunities throughout the East Dunbartonshire area, and indeed elsewhere within the wider area of Glasgow, and locations on the Glasgow – Stirling / Alloa and Glasgow - Edinburgh rail line for Options 8 and 9.

### 5.7.6.5 Regeneration Areas

The Scottish Indices of Multiple Deprivation (SIMD) measure levels of deprivation through means of seven key indicators: housing, crime, access, education, employment, health and income. The SIMD (2012) indicate that three of East Dunbartonshire's 127 datazones were amongst the 10% most deprived datazones in Scotland. All three of these datazones are within the study area: two are adjacent to each other in the Hillhead area of Kirkintilloch and the third is in Lennoxtown, as previously discussed.

Furthermore, the SIMD (2012) indicates that within East Dunbartonshire 8% of the population is classified as having income deprivation, which is below that of Scotland as a whole (13% of the population). Likewise, the level of employment deprivation is below that of the Scotlish average, with 8% of the working age population in East Dunbartonshire being classified as employment deprived compared to 13% across Scotland as a whole.

The following demonstrates the percentage of the population within certain age brackets that claim key benefits in East Dunbartonshire with comparisons to the Scottish average:

- The percentage of the population aged 16 to 24 claiming key benefits in East Dunbartonshire was 9% compared to a Scottish average of 13%;
- The percentage of the population aged 25 to 49 claiming key benefits in East Dunbartonshire was 11% compared to a Scottish average of 15%; and,
- The percentage of the population aged 50 to 64 claiming key benefits in East Dunbartonshire was 12% compared to a Scottish average of 19%.

According to the Annual Population Survey<sup>25</sup> (2013), the unemployment rate for people aged 16 or over for East Dunbartonshire was 5%; this was lower than the 8% rate for Scotland as a whole.

According to the Housing Statistics for Scotland<sup>26</sup> (2013), 12% of the dwellings in East Dunbartonshire were socially rented dwellings; this was less than the average for Scotland as a whole which stood at 24%.

<sup>23</sup> http://www.sns.gov.uk/Simd/Simd.aspx

<sup>&</sup>lt;sup>24</sup> http://www.sns.gov.uk/Simd/Simd.aspx

<sup>&</sup>lt;sup>25</sup> http://www.scotland.gov.uk/Topics/Statistics/Browse/Labour-Market/Local-Authority-Tables

<sup>&</sup>lt;sup>26</sup> http://www.scotland.gov.uk/Topics/Statistics/Browse/Housing-Regeneration/HSfS/KeyInfoTables

The Scottish Household Survey<sup>27</sup> (2012/2013) provides details on the number of cars available for private use by household. The results for East Dunbartonshire are as follows:

- 17% of the population had no access to a private car, compared with 31% for Scotland as a whole;
- 45% of the population had access to one car, compared with 44% for Scotland as a whole;
- 32% of the population had access to two or more cars, compared with 21% for Scotland as a whole; and
- 6% of the population had access to three or more cars, compared with 5% for Scotland as a whole.

The above statistics indicate that East Dunbartonshire, and by association the study area, is reasonably affluent when compared with Scotland as a whole. However, it is anticipated that the small pockets of deprivation in Hillhead and, to a lesser degree, Lennoxtown, will seek to benefit from the transport improvements proposed for the study area, primarily by virtue of increased accessibility to job and labour market opportunities being created within and outside the study area.

# 5.8 Integration

Environment integration is considered in Section 5.3 and integration with social inclusion is dealt with in Section 5.7. Issues relating to transport, land-use and policy integration will be reviewed in this Section.

### 5.8.1 Transport Integration

An integrated transport system must operate as a true network across all modes in order that passengers can move easily from one service to another in a comfortable environment. Integrated transport can, thus, reduce the need to travel, tackle congestion and pollution and support a strong economy, a sustainable environment and a healthy and inclusive society. Consideration of integrated transport typically considers the integration of different elements of the public transport network (ticketing, interchanges, timetables, inter-modal opportunities), but extends to include opportunities such as Park & Ride, and even Park and Share facilities.

It is considered that all of the Options will have a positive impact on transport integration through encouraging modal shift, with the exception of Option 7 whereby any positive impact would be negated by an increase in local traffic through populated areas as a result of additional parking at Lenzie Station.

Important elements which should be considered when planning integrated transport facilities include through ticketing / joint ticketing arrangements; enhanced connections and co-ordination of services; clear, accessible and wider availability of information; improved waiting facilities; appropriate location; and accessibility for the elderly and mobility impaired. Discussions with SPT have indicated that while integrated (including smartcard) ticketing may not be appropriate or practical to implement at a local, Council area level, initiatives to implement this on a regional or national basis are supported where schemes can assist in meeting project objectives. Indeed, it is understood that SPT are progressing ambitions for a region wide smart-ticketing / integrated ticketing initiative as well as real time bus passenger information at bus stops across Strathclyde which should be supported at the Council level given the potential for such schemes to deliver a step change in public transport usage at the local level.

The following statements can be made in terms of overall transport integration:

 Option 1 (Do Minimum) may achieve improvements to integration through the implementation of travel planning and walking and cycling measures, and measures implemented through the Kirkintilloch Town Centre Regeneration strategy and Glasgow City Council City Centre Strategy, however the overall impact on transport integration is expected to be neutral.

<sup>&</sup>lt;sup>27</sup> http://www.transportscotland.gov.uk/statistics/scottish-household-survey-local-area-analysis

70

Options 2 to 6, and Options 8 and 9 will have a positive impact on transport integration through the measures that they
promote:

- Quality Bus Corridor Package (Option 2): potential for improved information and signalling technology, together with a range of bus priority measures on the A803 between the Torrance Roundabout and Colston Road junction, together with improved access for pedestrians and cyclists, will improve integration between modes and reduce reliance on private car use.
- Bus Hub (Option 3): the development of a centralised bus hub would bring bus stops closer together into an interchange area in Kirkintilloch town centre and thus improve integration of bus services and make travel by bus more attractive. In addition, it is expected that design of the bus hub would incorporate clear, accessible and wider availability of information; improved waiting facilities (which may include, for example, quantity and quality of seating, and enhanced weather protection through improved shelter); and measures such as raised kerbs and bus boarders to assist accessibility for the elderly and mobility impaired. The bus hub would aim to provide a key bus interchange location and thus the distances between boarding points for different services would be reduced. It is proposed that the bus hub facility would be located in the centre of Kirkintilloch adjacent to the main pedestrian thoroughfare and would incorporate pedestrian and cycling access improvements thereby enhancing integration between walking, cycling and bus modes.
- Bus Park & Ride Facilities (Options 4 and 5): these would encourage people to transfer from cars to bus services for journeys to and from Glasgow. However, this may be negated by an increase in more local car trips to the Park & Ride facility and this would require to be considered appropriately at the design stage. The Park & Ride interchange sites would be designed with consideration given to quality of infrastructure, layout and information provision.
- Kirkintilloch / Lenzie Loop Bus (Option 6): the potential new loop bus service would link key locations such as Lenzie Rail Station, Kirkintilloch town centre, Woodilee, residential areas and the Council main offices, and would be timetabled to dovetail with rail services at Lenzie Rail Station, thus significantly improving integration between bus and rail modes.
- Increased rail station car parking at Lenzie (Option 7): this will encourage people to transfer from cars to rail services, thus improving the level of integration between the modes for longer journeys. However, this may be negated by an increase in more local car trips to the rail station and this would require to be considered appropriately at the design stage.
- New Rail Station and Park & Ride Facilities (Options 8 and 9): these Options will encourage people to transfer from cars to rail services, and Park & Ride facilities will be provided at dedicated interchange sites. However, this may be negated by an increase in more local car trips to the Park & Ride facility and this would require to be considered appropriately at the design stage. The interchange sites would be designed with consideration given to quality of infrastructure, layout and information provision. Due cognisance would require to be given to Options which impact on the wider rail network, specifically the EGIP proposals, to ensure effective integration. In addition, there is potential to broaden the halt at Westerhill (Option 9) to include provision as a freight interchange which would aid road-rail integration, however the feasibility of doing so would require a separate technical study.

### 5.8.2 Land-Use Transport Integration

Developments in UK and Scottish Government policy have provided a clear framework for the integration of land use and transport planning with a general requirement to promote sustainability and reduce the need to travel to relevant existing or future developments.

The land-use transport integration sub-objective should consider whether:

• Any land required for the proposal is preserved for uses which are incompatible with transport (for example, protected or conservation areas);

- The proposal fits with the general policies of all authorities at all levels concerning transport and land use; and
- The proposal conflicts with any other existing or planned development.

Thus, there is a requirement for the identification of the land-use policies or proposals conflicting with statutory planning documents at local, regional and national levels. This has been carried out to some extent during the STAG Part 1 process and no serious conflicts have been identified.

At a national level, the **Scottish Planning Policy (SPP) 2014** acts as Scotland's overarching policy framework. It provides policy guidance and support to the Scottish Government's transport vision through the integration of land use, economic development, environmental issues and transport planning, and replaces the previous 2010 SPP and a number of former policy documents including the former SPP17 – Planning for Transport. The SPP sits alongside other Scottish Government planning documents, including the National Planning Framework (NPF3, 2014), which sets out the Scottish Government's spatial development priorities for the next 20 to 30 years. The SPP sets out policy that will help to deliver the objectives of the NPF.

NPF3 and SPP 2014 share a single vision for the planning system in Scotland:

"We live in a Scotland with a growing, low-carbon economy with progressively narrowing disparities in well-being and opportunity. It is growth that can be achieved whilst reducing emissions and which respects the quality of environment, place and life which makes our country so special. It is growth which increases solidarity – reducing inequalities between our regions. We live in sustainable, well-designed places and homes which meet our needs. We enjoy excellent transport and digital connections, internally and with the rest of the world."

The SPP outlines that the planning system is a key mechanism for integration and should support patterns of development which:

- Optimise the use of existing infrastructure;
- Reduce the need to travel;
- Provide safe and convenient opportunities for walking and cycling for both active travel and recreation, and facilitate travel by public transport;
- Enable the integration of transport modes; and
- Facilitate freight movement by rail or water.

More locally, East Dunbartonshire Council adopted the Local Plan 2 in October 2011. The Local Plan 2 presents a number of policies and proposals for integrating land use and transportation in East Dunbartonshire. Of particular relevance to this study are the following proposals:

- TRANS 1 Development and Transport: the Council will take an integrated approach to development and transport with the aims of ensuring that the need for travel is reduced, that active and travel by public transport is facilitated and encouraged and the effect of air quality is ameliorated;
- TRANS 2 Road Design Guidance and Parking Standards: Development proposals must ensure that road layout and design ensures the safety of all users;
- TRANS 4 Rail Network and Park & Ride Facilities: the Council will support proposals which encourage extended capacity of rail infrastructure as opportunities arise; and
- TRANS 5 Active Travel Network, the Council will develop proposals defining and enhancing a safe and comprehensive active travel network, incorporating footpaths, cycleways and bridleways.

TRANS 4 further states that "The Council will support proposals which encourage extended capacity of rail infrastructure as opportunities arise. The Council will define and reserve sites...for new rail halts at Woodilee, Westerhill and Allander, pending an investigation... into the merits, costs and feasibility of these facilities. The Council will support the principle of expanded Park & Ride capacity, and related provision for active travel (including secure cycle storage) and convenient feeder bus services".

East Dunbartonshire Council is in the process of preparing a new Local Development Plan (LDP) for the area, which will replace the Local Plan 2. It is expected that the LDP will be adopted in 2016 and will guide the future use of land, set out proposals for development and provide the framework for dealing with planning applications.

'A Catalyst for Change' – The Regional Strategy for the West of Scotland 2007-2021 was published in 2007 by SPT. The vision of the Regional Transport Strategy (RTS) is:

"A world-class, sustainable transport system that acts as a catalyst for an improved quality of life for all".

Of specific relevance to the study area, the RTS Delivery Plan (2014-17) outlines SPT's commitment to help deliver a new station at Robroyston and to develop proposals for a strategic Park & Ride site in conjunction with proposals for Robroyston station; together with SPT's involvement in delivering the Kirkintilloch Masterplan.

Discussions with the Kirkintilloch Masterplan team and East Dunbartonshire Council's local planning team have indicated that none of the Options conflict with wider land-use proposals.

The following general statements can be made in terms of overall land-use transport integration:

- The Do Minimum scenario will have a neutral impact on land-use integration through the construction of committed schemes.
- Option 2 (A803 Quality Bus Corridor Package) This proposal has a minor positive impact on land-use integration
  through the implementation of quality bus measures to improve bus journey times and journey time reliability for all bus
  movements on the A803 corridor between the Torrance Roundabout and Colston Road junction. It is considered that this
  could provide improved access primarily for residents from Bishopbriggs commuting to / from Glasgow, and also
  potentially improve public transport access to the Strathkelvin Retail Park, Westerhill and the surplus Bishopbriggs
  Academy site. In addition, this Option has the potential to improve public transport access to Stobhill Hospital which is
  located in close proximity to the Colston Road junction. However, this Option will enhance existing levels of service
  provision and will not serve any new land-use areas.
- Option 3 (Bus Hub in Kirkintilloch) This option is aimed at providing a more attractive bus system (more information, improved infrastructure) within Kirkintilloch, which is likely to attract public transport users to this mode. It is expected to have a minor positive impact on land-use integration through its support of wider regeneration plans for the town.
- Option 4 (Bus Park & Ride in the vicinity of B757 / KLR) and Option 5 (Bus Park & Ride adjacent to Bishopbriggs Relief Road) These proposals have a moderate positive impact on land-use integration though the construction of bus-based Park & Ride facilities aimed at promoting a modal shift for commuting journeys between the study area and Glasgow, and providing access to a variety of land uses in the wider area including shopping, employment and transport. It is expected that the Park & Ride facility in the vicinity of the B757 / KLR (Option 4) would integrate with residential properties located to the east of the Link Road; and the Park & Ride facility adjacent to the BRR (Option 5) would integrate with existing and proposed residential developments in Bishopbriggs (for example, the Bishopbriggs East site). In addition, given the proximity of the large commercial / industrial units at the Westerhill business park, enhanced bus services associated with Option 5 could also offer sustainable access to Westerhill. It is understood that Transport Scotland has aspirations to implement hard-shoulder running on the M80 and, should this proposal be progressed in the future, it could complement the operation of the bus-based Park & Ride sites.

- Option 6 (Kirkintilloch / Lenzie loop bus) This option includes a potential new loop bus service linking key locations such as Lenzie Railway Station, Kirkintilloch Town Centre, Woodilee, residential areas and the Council main offices. This Option is expected to have a moderate positive impact on land-use integration through linking Lenzie rail station to a variety of land uses in the local area including shopping, housing, education, employment and transport.
- Option 7 (Increased Parking Provision at Lenzie Station) Through enhanced access to the rail network, this Option is
  expected to have a minor positive impact on land-use integration through improved access to land uses in the wider
  area.
- Option 8 (New Rail Station at Woodilee) This Option is primarily aimed at residents of Kirkintilloch. It could be used
  specifically by those living to the east of the KLR, and would support wider development in the area. It is anticipated that
  this Option would have a moderate positive impact on land use integration through the provision of access to a variety of
  land uses in the wider area including shopping, housing, education, employment and transport.
- Option 9 (New Rail Station at Westerhill) A rail station at Westerhill would encourage more sustainable travel to the Westerhill Business Park, which is seen as a growing economic centre. The rail station would be located adjacent to the BRR which would better enable car users to access the rail network, thus having a moderate positive impact on access to land uses in the wider area including education, employment and shopping. This option is expected to have a moderate positive impact on commuting trips to / from Glasgow, particularly for residents from Bishopbriggs (including proposed developments such as Bishopbriggs East), as well as employees from large employers such as Aviva and HarperCollins (both located in Westerhill). This Option may also encourage sustainable travel for staff and visitors to the H.M. Low Moss Prison. In addition, there is potential to broaden the station to include provision as a freight interchange which would aid economic development, however the feasibility of doing so would require a separate technical review.

Overall, it is considered that each of the Options would bring benefits to facilitating the achievement of land-use aspirations, to varying degrees, through promoting sustainability and reducing the need to travel. Furthermore, it is considered that none of the land required for the proposals is reserved for uses which are incompatible for transport.

Specifically in relation to the new rail stations (Options 8 and 9), it is noted that land to accommodate these Options is safeguarded within East Dunbartonshire Council's Local Plan 2. In addition, none of the proposals conflict with any other existing or planned development.

It is understood that North Lanarkshire Council is considering a Park & Ride facility at the Hornshill Junction within its City Deal bid, and due cognisance would require to be given to this proposal should Option 4 emerge as a preferred scheme.

# 5.8.3 Policy Integration

The Policy Integration criterion examines whether the proposed scheme contributes to, and is consistent with, other Government policies and legislation beyond transport. Consideration of transport planning policy has been undertaken within the STAG 1 and Pre-Appraisal stages of this study and no conflicts have been identified. A brief overview of key transport planning policies is provided below, together with consideration of wider Government policies.

In addition, a Planning Appraisal Framework (PAF) was used as part of the Initial Appraisal, to assess and demonstrate the contribution of each option to meeting current Scottish Government transport policy objectives. This has been refreshed in light of the STAG 2 appraisal, and is presented within Appendix H.

At a regional level, the **SPT RTS** supports a wealthier, fairer, healthier, safer, stronger, smarter, greener Scotland. It is considered that each of the Options will support the RTS goals through contributing to the following RTS objectives:

- Safety and Security: To improve safety and personal security on the transport system;
- Modal Shift: To increase the proportion of trips undertaken by walking, cycling and public transport;

- Excellent Transport System: To enhance the attractiveness, reliability and integration of the transport network;
- Effectiveness and Efficiency: To ensure the provision of effective and efficient transport infrastructure and services to improve connectivity for people and freight;
- Access for All: To promote and facilitate access that recognises the transport requirements of all;
- Environment and Health: To improve health and protect the environment by minimising emissions and consumption of resources and energy by the transport system;
- Economy, Transport and Land-Use Planning: To support land-use planning strategies, regeneration and development by integrating transport provision.

The SPP 2014 sets out four planning outcomes, and these outcomes are consistent across the NPF3 and SPP:

- A successful, sustainable place supporting sustainable economic growth and regeneration, and the creation of welldesigned, sustainable places;
- A low carbon place reducing our carbon emissions and adapting to climate change;
- A natural, resilient place helping to protect and enhance our natural and cultural assets, and facilitating their sustainable use; and
- A more connected place supporting better transport and digital connectivity.

The spatial strategy set out in NPF3 is complemented by an ongoing programme of investment in transport infrastructure. It outlines that the economy relies on efficient transport connections, within Scotland and to international markets, and planning can play an important role through improving connectivity and promoting more sustainable patterns of transport and travel as part of the transition to a low carbon economy.

The overall purpose of the **Scottish Government Economic Strategy (2011)** is to "focus the Government and public services on creating a more successful country, with opportunities for all of Scotland to flourish, through increasing sustainable economic growth". The measures proposed in all Options will help to encourage economic development through improving journey time reliability and enhancing the level of accessibility and inclusiveness to key services.

The **Glasgow and Clyde Valley Strategic Development Plan (SDP) (2012)** is a 25-year land use plan for Glasgow and the Clyde Valley city-region that supports the Scottish Government's central purpose of increasing sustainable economic growth. It provides "...a policy framework to help shape good quality places and enhance the quality of life in the city region. The Plan focuses on growing the economy of the city region in a low carbon and sustainable manner and setting out a planning framework which positively encourages investment within Glasgow and the Clyde Valley."

In the Competiveness section of the SDP it is stated that if low carbon economy in the city-region is to be achieved; climate change targets are to be met; the city-region's carbon footprint to be minimised; and the vision is to be delivered by 2035, transport within the city-region must undergo a significant step-change in terms of:

- An increase in the levels of active travel;
- The level and quality of public transport provision, increasing patronage and integration; and
- The scale of shift from private to public modes.

Schedule 4 – Public Transport Corridors and the Range of Potential Options for Public Transport Step-Change of the SDP identifies 14 public transport radial corridors across the city region (all of which converge on the city centre of Glasgow), as well

75

as a range of potential broad-level strategic options and interventions which could meet the need for step-change. Specifically, corridor R2 includes the A803 corridor:

 Corridor R2 – Bishopbriggs / Kirkintilloch / Kilsyth: potential public transport change options along this corridor are to improve core bus frequencies and routing. In addition, Kirkintilloch is identified as a strategic centre due to its historic town centre with strong civic, community, cultural and visitor functions. In order to support this role in the future, opportunities to deliver regeneration (investment in the quality of the public realm) and to improve the range and quality of the retail offer are identified.

The **Climate Change Act 2008** sets national targets for reductions in greenhouse gas emissions. The Act outlines that the net UK carbon account for the year 2050 should be at least 80% lower than the 1990 baseline and that CO2 emissions should be reduced by at least 26% of their 1990 baseline levels. It is considered that each of the Options, through the promotion of public transport, will reduce the adverse environmental impacts of private car traffic, particularly harmful local emissions.

Prior to the **Equality Act 2010**, there were three separate public sector equality duties covering race, disability and gender. The Equality Act 2010 replaced these with a new single equality duty covering race, sex, disability, sexual orientation, religion and belief, age, gender reassignment and pregnancy and maternity. The new duty in the Equality Act 2010 came into force on 5 April 2011 and replaces all previous equality legislation including the Disability Discrimination Act 1995.

In the context of this study, such adjustments will be covered through Option 2 (Quality Bus Corridor), Option 3 (Bus Hub) and Option 6 (Loop Bus), for example high access kerbs, shelters, tactile paving and information provision. The new Park & Ride and station facilities (Options 4, 5, 8 and 9) would be designed with consideration given to quality of infrastructure, layout and information provision and, where appropriate, the use of measures such as, but not limited to, tactile paving, dropped / raised kerbs and audible crossing warnings. Option 7 (Increased Parking Provision at Lenzie Station) would also incorporate measures such as the appropriate use of signage, dropped kerbs etc. and allocation of accessible bays for the mobility impaired, as appropriate.

The **EDC Joint Health Improvement Plan (2013-2016)** sets out the commitment of East Dunbartonshire Council, East Dunbartonshire Community Health Partnership and partners to work together to improve the health and wellbeing of people living in East Dunbartonshire and to reduce health inequalities throughout the area. The relevant high level outcomes which the Options contribute to are as follows:

- Improve active travel infrastructure (all Options through the provision of sustainable transport and / or sustainable access measures);
- Improve access to training and employment opportunities (all Options through increased access to, and / or extension of, public transport provision);
- Increase community safety (all Options through the promotion of public transport); and
- Improve transport infrastructure to improve access to health, leisure services and employment (all Options).

The following general statements can be made in terms of overall policy integration:

- Do Minimum minor / negligible impact on policy integration through the implementation of measures such as travel plans and sustainable travel policies, together with proposals for the Kirkintilloch Town Centre Regeneration and Glasgow City Council City Centre Strategy, which will encourage modal shift.
- All Options promote sustainability and reduce the need to travel to varying degrees through the provision of Quality Bus measures, Park & Ride facilities, new rail stations, new bus services, improved interchange facilities and improved access to existing public transport facilities, all of which could encourage modal shift and assist in achieving a healthy, prosperous and inclusive society.

In addition, the Options will contribute to the following wider Government policies:

- Disability The design of the Park & Ride facilities (Options 4 and 5), new rail stations (Options 8 and 9) and bus hub (Option 3) will be fully compliant with the Equality Act 2010 and will provide easy access to wheel chairs and push chairs, thus facilitating access for the mobility impaired, including the elderly and those with young children. The quality bus measures (Option 2) and bus service improvements / new bus services (Option 6) would also assist in providing easier access to bus services for the mobility impaired through low-floor vehicles and bus boarders. The increased parking provision at Lenzie rail station (Option 7) would be designed to take due cognisance of the Equality Act 2010 and there would be potential to combine with any works to make the station more accessible (current footbridge with stairs only);
- Health The expected modal shift from car to public transport for journeys by local residents and others travelling to
  employment, education and recreational facilities will provide greater opportunities for increased walking and cycling trips
  to reach public transport stops. In addition, the use of public transport (as opposed to cars) will reduce the adverse
  environmental impacts of traffic, particularly harmful local emissions, with an overall positive effect on health, albeit the
  impact of this may be negated in relation to Option 7 if increased parking at Lenzie Rail Station results in additional traffic
  on local roads;
- Rural affairs The Options do not reach rural areas and therefore can do very little to contribute to improve rural affairs
  or retaining rural communities;
- Social exclusion Each of the Options, except Option 7, fit in with policies to promote social inclusion, by enabling the
  people who live in socially deprived areas (particularly those with no access to a car) access to the public transport
  network. It is anticipated that Options 3 and 6 would perform best in this regard, by improving access to the public
  transport network for those residing within the Hillhead area of Kirkintilloch.

It can therefore be said that each of the Options has the potential to be supportive of national policies beyond transport.

### 5.8.4 Summary

Table 5.14, on the following page, provides a summary of the performance of each Option against the STAG Integration criteria.

Table 5.14: Performance Against STAG Criteria: Integration

STAG Part 2 C	STAG Part 2 Options									
Integration Criteria	Integration Sub- Objective	1 – Do Minimum	2 – A803 QBC Package	3 – Bus Hub in Kirkintilloch and Associated Measures	4 – Bus Park & Ride in Vicinity of B757 / KLR	5 – Bus Park & Ride Adjacent to BRR	6 – Kirkintilloch / Lenzie Loop Bus	7 – Increased Parking Provision at Lenzie Rail Station	8 – New Rail Station at Woodilee (with Park & Ride)	9 – New Rail Station at Westerhill (with Park & Ride)
Transport	Services and Ticketing	0	+1	+2	+2	+2	+2	0	+1	+1
Interchanges	Infrastructure and Information	0	+2	+2	+2	+2	+2	+1	+2	+2
Land-Use Integration	-	0	+1	+1	+2	+2	+2	+1	+2	+2
Policy Integration	-	0	+2	+2	+2	+2	+2	+1	+1	+1
		Overall neutral impact on integration through implementation of committed schemes.	QBC measures expected to improve integration between modes and reduce car use. Will enhance existing levels of service provision but not serve new land- use areas. Promotion of sustainable transport is in line with Government policies relating to transport and beyond.	Enhances integration between walking, cycling and bus modes. Supports wider regeneration plans for Kirkintilloch town centre. Improves accessibility for socially excluded and those without car access. Promotion of sustainable transport is in line with Government policies relating to transport and beyond.	Encourages transfer of trips from car to bus. Integrates with residential development at Woodilee and to east of KLR. Promotion of sustainable transport is in line with Government policies relating to transport and beyond.	Encourages transfer of trips from car to bus. Integrates with existing and proposed residential development e.g. Bishopbriggs East. Provides sustainable access to Westerhill business park. Promotion of sustainable transport is in line with Government policies relating to transport and beyond.	Enhances bus – rail integration, linking key land use destinations. Improves accessibility for socially excluded and those without car access. Promotion of sustainable transport is in line with Government policies relating to transport and beyond.	Encourages transfer of trips from car to rail for longer journeys but impact may be negated by increase in more local car trips to Lenzie station. Improves access to land uses in the wider area via the rail network. Promotion of sustainable transport is in line with Government policies relating to transport and beyond, but impact negated if increased parking results in increased traffic on local roads. Maximises use of existing infrastructure.	Encourages transfer of trips from car to rail. Improves access to land uses in the wider area via the rail network. Promotion of sustainable transport is in line with Government policies relating to transport and beyond, but impact negated if increased parking results in increased traffic on local roads. Land safeguarded in Local Plan 2.	Encourages transfer of trips from car to rail. Improves access to Westerhill business park and land uses in the wider area via the rail network. Promotion of sustainable transport is in line with Government policies relating to transport and beyond, but impact negated if increased parking results in increased traffic on local roads. Land safeguarded in Local Plan 2.

# 5.9 Accessibility and Social Inclusion

Accessibility defines the ability of people and businesses to access goods, services, people and opportunities. STAG highlights four aspects of accessibility that require to be considered in relation to transport schemes, grouped under the headings of Community Accessibility and Comparative Accessibility. These are:

- Community Accessibility
  - Public transport network coverage; and
  - Access to local services.
- Comparative Accessibility
  - Distribution of impacts by people group; and
  - Distribution of impacts by location.

In addition, STAG requires consideration of how policies (including activities, functions, strategies, programmes, and services or processes) may impact, positively or negatively, on different sectors of the population in different ways and this is considered within the framework of an Equality Impact Assessment.

# 5.9.1 Community Accessibility

Community accessibility relates to the existing public transport network coverage and access to local services and both of these elements are reviewed below.

# 5.9.1.1 Public Transport Network Coverage

This is measured by the changes in the number of people with public transport access to key services and destinations.

Bus is an important mode of access in the study area. There is a strong network of bus services, combining local services with Express services with limited stops to Glasgow. The STAG 1 report provides details of bus service provision within the study area, and a summary of services is provided within Table 5.15.

Mode	Bishopbriggs town centre and rail station	centre and rail station	Kirkintilloch	Surrounding towns	Key trip generators
Bus					
Bus Supply	<ul> <li>147 to Scotstoun, every 30mins AM</li> <li>27 and 24 (Kirkintilloch, Bishopbriggs)-Glasgow, hourly</li> <li>88 (A,C) Kirkintilloch/ Bishopbriggs – Glasgow, every 15mins (30mins Sunday)</li> <li>142 Bishopbriggs Auchinairn/Westerhill, every 40mins</li> <li>147 Scotstoun- Bishopbriggs, limited service</li> <li>57, 57A – Westerhill/Auchinairn- Glasgow, every 15min (every 20min on Sundays)</li> </ul>	178 to Kirkintilloch / Moodiesburn, hourly X81 Woodhill- Glasgow, every 30mins, Mon-Fri 72 Glasgow- Lenzie / Kirkintilloch - hourly	X85, X86, X87 to Glasgow – between every 12min and hourly Mon-Sat 47/47A Milngavie- Monklands Hospital via Kirkintilloch, every 30mins 84 Twechar- Kirkintilloch, hourly 88 (A,C) Kirkintilloch/ Bishopbriggs – Glasgow, every 15mins (30mins Sunday) 72 Glasgow- Lenzie / Kirkintilloch - hourly 27 and 24 (Kirkintilloch, Bishopbriggs)- Glasgow – hourly 178 to Kirkintilloch / Moodiesburn, hourly	84 Twechar Kirkintilloch 344 Twechar- Croy Station, AM and PM Twechar, hourly Sunday 47/47A Torrance	142 / 57 Westerhill, X81 Woodhill (although does not penetrate the residential estate)

# Table 5.15: Bus Service Provision within Study Area<sup>28</sup>

Lenzie town

These services are likely to provide an attractive option for those without access to a car and play a key part in maintaining good accessibility within the study area. However, bus operator consultation and journey time surveys indicate some services on the A803 are subject to significant journey time variability during peak times due to high levels of traffic and queuing which affect journey times and reliability thus reducing the attractiveness of bus as mode of transport along this corridor during peak periods.

Within Kirkintilloch town centre, evidence gathered through the STAG Part 1 consultation process indicated that bus stops are not conveniently located and do not support integration between services, thus making travel by bus and bus-to-bus interchange unattractive to users. It has been identified that bus journey time reliability on the A806 is an issue, particularly during peak times. The lack of information on available bus services operating through Kirkintilloch town centre was also raised as a recurring theme during consultation.

<sup>&</sup>lt;sup>28</sup> As at February 2014

Bishopbriggs and Lenzie rail stations are located within the study area, in addition to the proposed stations at Westerhill and Woodilee, as shown in Figure 5.2. These stations are both situated on the Edinburgh - Glasgow line. They provide direct services between East Dunbartonshire, Glasgow, Stirling, Dunblane and Alloa. A small number of direct services operate between the stations and Edinburgh via the Falkirk line during peak travel periods. Table 5.16 summarises rail service provision.

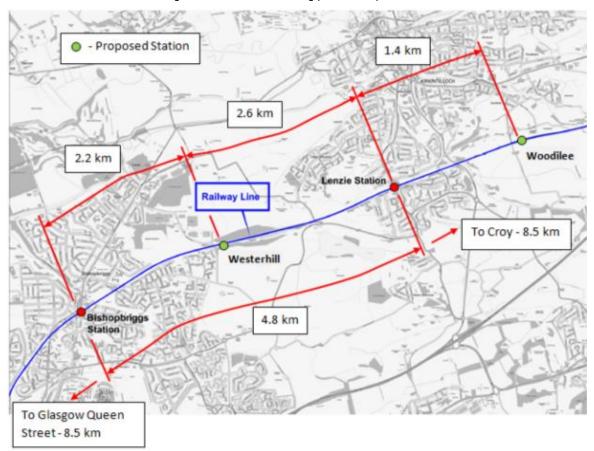

Figure 5.2 – Location of Bishopbriggs and Lenzie Rail Stations in relation to proposed stations

# Table 5.16: Rail Service Provision within Study Area

Rail	Bishopbriggs	Lenzie	Kirkintilloch	Surrounding towns and other trip generators
Rail Supply	Existing rail service, served by Stirling/Alloa-Glasgow trains, and Edinburgh- Glasgow via Falkirk High trains (limited stop) Approx. 2 direct train services per hour to Glasgow off peak, up to 4 during peak. Hourly in the evenings and Sundays. Journey time to Glasgow 8- 11 minutes	Existing rail service, served by Stirling/Alloa-Glasgow trains, and Edinburgh-Glasgow trains (limited stop) Approx. 2 direct train services per hour to Glasgow off peak, up to 6 during peak. Hourly in the evenings and Sundays. Journey time to Glasgow 13-16 minutes	Not connected to the rail network. Closest rail connections via Bishopbriggs (15min journey by First service 27) or Lenzie (7 min journey by First service X87/X85). Also only 5.6 miles to Croy rail station (although no direct bus), or 8.2miles to Milngavie and 25min bus journey (Henderson Travel 47). Comparable service levels to Glasgow from Croy and Milngavie.	Not connected to the rail network. Closest rail stations – Bishopbriggs, Lenzie, Croy, Milngavie. E.g. Torrance - 13min journey time by bus (First Glasgow 89B) to Bishopbriggs rail station, or 17min journey by bus (Henderson Travel 47) to Milngavie station.
Rail Demand	ORR data – rail station usage forecasts, rising demand at Bishopbriggs and continuing to grow.	ORR data – no significant growth in usage at Lenzie.	ORR data – growing demand at both Milngavie and Croy stations, but no significant growth at Lenzie.	ORR data – growing demand at Bishopbriggs, Milngavie and Croy stations but no significant growth at Lenzie.
Evidence of Issues	Standing room only on peak trains to Glasgow <sup>29</sup> . No parking at Bishopbriggs rail station but no evidence that this is acting as a constraint – adjacent free, public car park (at Bishopbriggs public park, 5 mins walk from station) is under-utilised). May be some rail-related parking on adjacent residential streets primarily Brackenbrae Avenue (EDC Parking Strategy 2008)	Standing room only on peak trains to Glasgow. Existing car parks at Lenzie (some 149 spaces) are full after the weekday peak and may be acting as a deterrent to further rail growth. SPT surveys <sup>30</sup> suggest a lower than average proportion of drivers using Lenzie rail station park at the official car park, citing lack of available space as a reason. Woodilee Transport Assessment suggests that Lenzie Station is "well used, with the car park being always full and parking demand overspilling onto the surrounding residential streets".	Anecdotal - lack of parking at Lenzie means some prefer to drive to Milngavie or Croy to use rail services and Park & Ride. Direct bus services are available from Kirkintilloch to both Bishopbriggs and Lenzie rail stations. Frequency of rail services during the peak mean that timetable integration is not a major issue. May be more of an issue inter-peak / off-peak.	Anecdotal - lack of parking at Lenzie means some prefer to drive to Milngavie or Croy to use rail services and Park & Ride. Direct bus services are available from some settlements to rail stations in the study area, although Milngavie may be more accessible depending on location.

<sup>&</sup>lt;sup>29</sup> In addition, the Network Rail Scotland Route Utilisation Strategy Generation 2 (June 2011) states that "the morning peak arrivals at major centres can often experience load factors in excess of 100 per cent as they serve both interurban and local commuter markets. This occurs on the approach to both Glasgow and Edinburgh." It should also be noted that data from the model development report for CSTM, which derives rail demand based on amongst others travel diary and ticketing data, lists Stirling in to GQS as one of most congested parts of the network.

<sup>&</sup>lt;sup>30</sup> Park & Ride in the SPT Area: Results from 2013 User Surveys

Overall, East Dunbartonshire has experienced considerable growth in rail patronage over recent years, and the Office of Rail Regulation (ORR) rail station usage forecasts expect demand at Bishopbriggs to continue to grow. Investment in infrastructure enhancements, including the extension of platform lengths at Bishopbriggs rail station, has both supported and attracted rail patronage. Although patronage growth at Lenzie rail station has been low in comparison to other stations, it is East Dunbartonshire's second busiest station and primarily serves a large area of population (Lenzie and Kirkintilloch). Growth at this station may be constrained due to the lack of available car parking for rail passengers to use, especially during the inter-peak travel period and in comparison to that provided at Croy rail station. Anecdotal evidence gathered during stakeholder

There is no rail station within Kirkintilloch and lack of parking at Lenzie means some prefer to drive to Milngavie or Croy to use rail services and Park & Ride. Direct bus services are available from Kirkintilloch to both Bishopbriggs and Lenzie rail stations and the frequency of rail services during the peak mean that timetable integration is not a major issue. However, it is anticipated that the associated journey and interchange times do not make this an attractive travel option, particularly during inter-peak / off-peak times when the rail service is limited to half-hourly.

consultations undertaken during STAG 1 and STAG 2 suggests that existing car parks at Lenzie (some 149 spaces) are full

after the weekday peak and may be acting as a deterrent to further rail growth.

It is considered that each of the Options would increase accessibility by public transport by realising key benefits for those who do not have access to a private car or choose not to travel by car for their whole journey due to factors such as cost and availability of parking at their destination, journey times, journey time unreliability etc. Benefits associated with improved public transport accessibility include:

**Economic:** for rail-based options (Options 7, 8 and 9) the number of people able to access local and city centre employment opportunities will increase, given the speed and capacity characteristics of rail versus other modes. This could lead to increased demand for rail. Options 8 and 9, through the construction of new rail stations would increase public transport network coverage. The implementation of Quality Bus measures (Option 2) would improve bus journey times and journey time reliability for both local trips and also commuter trips to / from Glasgow via the A803, albeit there would be no increase in level of public transport coverage. The development of a bus hub in Kirkintilloch (Option 3) could assist in reducing town centre congestion through the centralisation of bus stop locations, and would improve bus journey times and journey time reliability for local trips, albeit, again, there would be no increase in public transport coverage. The implementation of bus-based Park & Ride (Options 4 and 5) would increase the attractiveness of bus as a mode of transport for commuting trips to / from Glasgow and would potentially remove pressure from the rail network and assist in alleviating Lenzie Rail Station parking difficulties. The introduction of a Kirkintilloch / Lenzie loop bus service (Option 6) would increase public transport network coverage and improve access to Lenzie rail station, thereby increasing the number of people able to access local and city centre employment opportunities. Furthermore, the loop bus service would assist in improving access to employment opportunities within Kirkintilloch town centre, both for those who would make the journey entirely by bus and those who would interchange with rail services at Lenzie.

Environmental: public transport, particularly rail transport, has significant potential to lower CO2 emissions through modal shift from car.

**Social:** by encouraging some motorists to switch modes for at least part of their journey, this will reduce congestion levels and deliver other qualitative benefits, including improved quality of life and amenity.

Stakeholder feedback and primary research suggest that CCTV, lighting and tarmac roads are an integral part of the overall design process in terms of encouraging users, and these features should be taken into account when designing the Park & Ride facilities associated with Options 4, 5, 8 and 9. The absence of these 'complementary factors' would reduce the attractiveness of any Park & Ride facility.

In terms of decongestion and environmental benefits, evidence has suggested that the impact associated with the provision of Park & Ride facilities at rail stations is negligible. Whilst some travellers may choose to use rail for a proportion of their journey

as a result of increased availability of parking spaces, evidence suggests that this is offset by travellers previously walking/cycling/using other means of public transport to travel to the station now choosing to drive and park at the station<sup>31</sup>. This is also considered relevant in terms of bus-based Park & Ride sites.

### 5.9.1.2 Access to Local Services

The local accessibility criterion considers walking and cycling access to local activity centres and to public transport.

The Do Minimum is expected to have a minor positive impact on walking and cycling access to local services through the implementation of walking and cycling measures through, for example, the Kirkintilloch Town Centre Regeneration plans and the implementation of other local sustainable travel policies.

Options 2 and 3 may promote further non-motorised trips to access local services through the provision of quality bus measures and improved public transport provision. This, together with complementary measures to improve accessibility for pedestrians and cyclists, is expected to provide minor positive benefits. The bus improvements associated with the loop service (Option 6) will also be of benefit in improving access to local services, particularly within Kirkintilloch and providing linkages to Lenzie. This is particularly important in terms of tackling social exclusion and providing sustainable transport access to key services, facilities and employment for those without direct access to a rail station, and Option 6 is anticipated to provide a moderate positive impact in this regard. In addition, Options 4, 5, 8 and 9 may also promote non-motorised access to local services through the provision of a Park & Ride facility.

There are no anticipated issues relating to severance for pedestrians or cyclists as a result of implementation of any of the proposed Options. The new Park & Ride facilities (Options 4, 5, 8 and 9) should include facilities for cycle provision and pedestrian links to the surrounding facilities. In addition, consideration to access routes for pedestrians and cyclists will form a key element in the implementation of all Options, and availability of cycle parking will be considered in the design of Options 4, 5, 7, 8 and 9.

Overall the impact on local accessibility is expected to be minor positive for the Do Minimum. The net impact for the other Options is likely to be minor to moderate positive, with the exception of Option 7 whereby the net impact is likely to be neutral due to the impact of increased levels of traffic on local roads negating any accessibility benefits to pedestrians and cyclists.

### 5.9.2 Comparative Accessibility

The distribution of accessibility impacts is relevant in that it identifies the extent to which the proposals benefit certain social groups (for example, car availability, gender, age, employment status, mobility impairment, income, trip purpose) or geographical locations (for example regeneration, deprivation or development areas, areas of poor public transport provision) most in need of access by public transport to essential activities.

### 5.9.2.1 Distribution of Impacts by People Group

The Socio Economic analysis undertaken within the Pre Appraisal and STAG Part 1 reports examined a number of measures of social exclusion and concluded that the study area is largely affluent when compared to the rest of Scotland and the U.K.

Key highlights are as follows:

• Unemployment within the study area is relatively low, compared to levels within Scotland and the U.K.;

<sup>&</sup>lt;sup>31</sup> STAG Technical Database, Section 11.6.4

- Employment within the study area is skewed towards highly skilled occupations and industries the health, education
  and financial services are the largest employers;
- Workers within the EDC area enjoy above average level of wages;
- The study area experiences high levels of car ownership; and
- Most of the study area has been classified as having the lowest levels of deprivation in Scotland.

The pressing issue in terms of the socio-economic make-up of the study area is that car ownership is particularly high. This is an indicator of the other trends uncovered in the analysis towards highly skilled employment, above average wages and low overall deprivation. The result of this high level of car ownership and employment centred in Glasgow is that the private car is the most popular mode of travel along the A803 Corridor.

Despite being a generally affluent area, the Scottish Index of Multiple Deprivation (SIMD 2012)<sup>32</sup> shows there are certain pockets in the study corridor (particularly around Kirkintilloch) where the level of deprivation is between the 20-40% National 2012 Quintiles. These households would benefit from improved walking, cycling and public transport access to services and employment opportunities.

Table 5.17 summarises the age, gender and limiting long-term illness statistics for key standard Census wards within the study area, compared to statistics for East Dunbartonshire and Scotland.

	Age (years)			Gender		Long-Term Health Problem or Disability			
Ward	%	%	%	• % Male % Female a		Day-to-day	Day-to-day	Day-to-day	
	0-15	16-64	65+			activities limited a lot	activities limited a little	activities not limited	
Lenzie and Kirkintilloch South	17.3%	63.8%	18.8%	48.9%	51.1%	7.6%	9.5%	82.9%	
Kirkintilloch East and Twechar	19.0%	65.4%	15.6%	48.4%	51.6%	11.2%	10.2%	78.6%	
Campsie and Kirkintilloch North	17.0%	65.2%	17.7%	47.8%	52.2%	9.5%	9.4%	81.1%	
Bishopbriggs South	17.8%	65.3%	17.0%	47.8%	52.2%	8.6%	9.8%	81.7%	
Bishopbriggs North and Torrance	17.0%	61.4%	21.6%	48.4%	51.6%	7.4%	9.6%	83.0%	
East Dunbartonshire	17.8%	62.7%	19.5%	48.2%	51.8%	7.8%	9.5%	82.6%	
Scotland	17.3%	65.9%	16.8%	48.5%	51.5%	9.6%	10.1%	80.4%	

he Studv Area
ne

<sup>32</sup> http://www.scotland.gov.uk/Resource/0041/00410724.pdf

As indicated within Table 5.17, the Bishopbriggs North and Torrance ward displays a higher proportion of population aged over 65 years (21.6%), when compared to the average for East Dunbartonshire (19.5%) and Scotland (16.8%). In addition, the ward of Kirkintilloch East and Twechar contains a higher proportion of population under 16 years (19.0%), when compared to the average for East Dunbartonshire (17.8%) and Scotland (17.3%).

The data above also indicates that the gender profile across the study area is in line with that across East Dunbartonshire as a whole, and across Scotland.

The Kirkintilloch East and Twechar ward displays a lower level of population whose day-to-day activities are not limited due to a long-term health problem or disability (78.6%) when compared to the statistics for East Dunbartonshire (82.6%) and Scotland (80.4%).

Overall, the Do Minimum is expected to have a minor positive impact through the implementation of local sustainable travel policies.

It is considered that Options 2, 4, 5, 8 and 9 would have a minor positive impact in terms of tackling the problem of private car use by encouraging a modal shift towards public transport and sustainable modes of travel and improving accessibility to the public transport network. Whilst this will enhance the level of accessibility for those without the use of a car, existing car users will also be encouraged to leave their cars at home in favour of other modes. In addition, households located within the small pockets of deprivation in Kirkintilloch would particularly benefit from improved access to services and employment opportunities afforded by Options 3 and 6, and these Options are therefore expected to have a moderate positive impact in this regard.

Option 7, however, would be anticipated to bring a slight increase in access to rail services to those who own a car only; therefore, this Option is expected have an overall neutral impact.

### 5.9.2.2 Distribution of Impacts by Location

The discussion above has demonstrated that there is an overall minor positive gain in accessibility associated with each of the Options, primarily through encouraging modal shift and reducing overall reliance on the private car for local and commuter trips. Whilst the study area is generally affluent, the small areas where issues of social exclusion are most important, and those which are particularly dependent on public transport, share in this improvement.

As previously discussed, a number of key developments are proposed within the study area, including a masterplan for the surplus Bishopbriggs Academy site; the redevelopment of Kirkintilloch town centre; a mixed—use redevelopment plan for the Kirkintilloch Business Gateway; improving the comparison goods retail offer at Strathkelvin Retail Park; protection and development of the Strategic Industrial and Business Location at Westerhill, Bishopbriggs; and various new housing sites across the study area. In addition, there are substantial new housing developments located at Woodilee and Bishopbriggs East. This proposed development will create growth in housing, employment, office and business accommodation, and potentially leisure facilities, and commercial and retain developments.

The A803 provides a strategic route through the study area, and a key route into Glasgow, together with the B747 and A806 (Kirkintilloch Relief Road). As previously discussed, the A803 currently experiences operational problems, particularly during peak periods, and further development in the local area would create increased congestion problems. As outlined above, the trend for increased activity is set to continue with further development within the local area. Clearly such development areas would benefit from improved accessibility brought about by improvements to public transport provision.

Figure 5.3 illustrates key development proposals in the study area, together with the location of each Option. Overall, it is expected that the Do Minimum would have a neutral impact on improving access to development and regeneration areas. It is further anticipated that Options 2, 6, 8 and 9 would have a moderate positive impact. Options 3, 4 and 5 would have a lesser impact, but a minor positive impact overall. It is expected that Option 7 would bring a slight increase in access to rail services for those who own a car, but is unlikely to provide improved access to development and regeneration sites and thus this Option is expected to have a neutral impact.

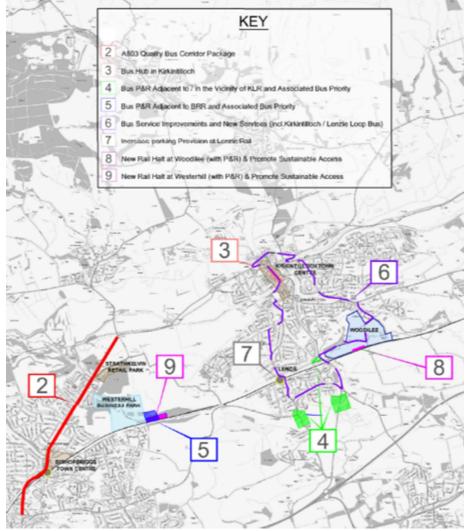

Figure 5.3 – Key Development Proposals and Option Locations

# 5.9.3 Equality Impact Assessment

The Public Sector Equality Duty requires public authorities to have due regard to the need to eliminate unlawful discrimination, advance equality of opportunity and foster good relations. It covers the 'protected characteristics' or age, race, disability, sex, religion or belief, sexual orientation, gender reassignment and pregnancy and maternity. As part of this requirement, public bodies should take due consideration of the impact of their policies and practices on their ability to meet the duty through the undertaking of an Equality Impact Assessment (EQIA).

EQIA considers how policies (including activities, functions, strategies, programmes, and services or processes) may impact, either positively or negatively, on different sectors of the population in different ways. It also helps to identify unlawful discrimination and opportunities for the advancement of equality.

An EQIA was undertaken at STAG 1. The EQIA has been refreshed in light of the Options being considered at STAG 2, and is presented within Appendix G. Overall, it is considered that the Options presented at STAG 2 fulfil the requirements of the EQIA process, through the promotion of measures aimed at promoting active travel and public transport, which would reduce reliance on the car, at least for part of the journey, to make trips along the study corridor thus benefiting all groups.

# 5.9.4 Accessibility Mapping

Accessibility mapping has been produced for those Options which involve a change in levels of public transport accessibility, namely the bus-based Park & Ride Options (Options 4 and 5), the loop bus (Option 6), and the new rail stations (Options 8 and 9), using Accession software. For these Options, the accessibility mapping shows the existing accessibility and the future accessibility should each Option be implemented. The accessibility mapping considers walking, bus, and train as modes of travel but not the private car. The accessibility mapping is provided in Appendix I and a summary of the main results is as follows:

Option 4:

- The proposed locations for the Park & Ride site adjacent to the B757 are adjacent to existing bus stops so this Option does
  not improve accessibility from this location. However, this Option would make the bus more accessible for those who live at
  a distance from this location and could drive to the Park & Ride site (albeit this is not shown on the accessibility mapping as
  private car is not considered as a mode of travel). For example, it may be attractive for those living in Kirkintilloch and
  Lenzie, who are not within a 10-minute walk of an express service to Glasgow, to drive to the Park & Ride site to use such
  an express service.
- The Park & Ride facility adjacent to the KLR with the X86 services stopping at the site would improve accessibility. As above, this Option would make the express service to Glasgow more accessible for those who live at a distance from this location and could drive to the Park & Ride site.

#### Option 5:

The proposed location for the Park & Ride site adjacent to the BRR with a 15-minute frequency would improve accessibility
from this location to Glasgow City Centre and the west and north west of the City Centre.

#### Option 6:

 The proposed bus loop service increases accessibility from Lenzie rail station to the east of Kirkintilloch (and vice versa); the area of Hillhead for example, which is included in the 5% of most deprived areas in Scotland.

#### Option 8:

It should be noted that within the accessibility mapping there appears to be an existing accessibility by rail from Woodilee.
 This is due to the software considering that one could, in theory, walk from Woodilee to Lenzie and then use a train for their onward journey. However, due to the distance involved this is unlikely to be attractive.

The proposed rail station at Woodilee improves accessibility to Croy, Lenzie, Bishopbriggs and Glasgow city centre. These locations are currently accessible by bus (as can be seen in Drawing-008-002, Appendix I) but travel by rail would improve journey times to Glasgow city centre by approximately 10 minutes, Bishopbriggs by 15 minutes and Lenzie by 5 minutes. The new station would be particularly accessible from the Woodilee development which is not currently well served by public transport.

Option 9:

- As is the case with Option 8, within the accessibility mapping there appears to be an existing accessibility by rail from Westerhill. This is due to the software considering that one could, in theory, walk from Westerhill to Bishopbriggs and then use a train for their onward journey. However, due to the distance involved this is unlikely to be attractive.
- The proposed rail station at Westerhill improves accessibility to Croy, Lenzie, Bishopbriggs and Glasgow city centre. These locations are currently accessible by bus (as can be seen in Drawing-009-002, Appendix I) but the train would improve journey times to Glasgow city centre by approximately 10 minutes, Bishopbriggs by 5 minutes and Lenzie by 20 minutes. The Westerhill station would be accessible by foot for those living in proximity of Wester Cleddens Road and the Westerhill business park is within a 5- to 15-minute walk from the proposed station.

#### 5.9.5 Summary

Table 5.18, on the following page, provides a summary of the performance of each Option against the STAG Accessibility and Social Inclusion criteria.

Table 5.18: Performance against STAG Criteria: Accessibility and Social Inclusion

STAG Part 2 Options										
Accessibility and Social Inclusion Criteria	Accessibility and Social Inclusion Sub-Objective	1 – Do Minimum	2 – A803 QBC Package	3 – Bus Hub in Kirkintilloch and Associated Measures	4 – Bus Park & Ride in Vicinity of B757 / KLR	5 – Bus Park & Ride Adjacent to BRR	6 – Kirkintilloch / Lenzie Loop Bus	7 – Increased Parking Provision at Lenzie Rail Station	8 – New Rail Station at Woodilee (with Park & Ride)	9 – New Rail Station at Westerhill (with Park & Ride)
Community Accessibility	Public Transport Network Coverage	0	0	0	+1	+1	+2	0	+2	+2
	Access to Other Local Services	+1	+1	+1	+1	+1	+2	0	+1	+1

/ tooosionity	Distributional / Spatial Impacts by Area	0	+2	+1	+1	+1	+2	0	+2	+2
Summary Rational for Scoring		Minor impact on walking and cycling access to local services through implementation of committed walking and cycling measures.	Increases accessibility by PT, realising key benefits for those without access to a private car or who choose not to travel by car for their whole journey. Offers enhanced service provision but no increase in PT network coverage. Increases accessibility to development areas e.g. Bishopbriggs Academy site, Strathkelvin Retail Park. No severance issues.	Increases accessibility by PT, realising key benefits for those without access to a private car or who choose not to travel by car for their whole journey. Offers enhanced service provision but no increase in PT network coverage. Increases accessibility to development areas e.g. Woodilee. Pockets of deprivation in Kirkintilloch would benefit from increased access to services and employment opportunities. No severance issues.	Increases accessibility by PT, realising key benefits for those without access to a private car or who choose not to travel by car for their whole journey. Offers increase in PT network coverage. Increases accessibility to development areas e.g. Woodilee. No severance issues.	Increases accessibility by PT, realising key benefits for those without access to a private car or who choose not to travel by car for their whole journey. Offers increase in PT network coverage. Increases accessibility to development areas e.g. Bishopbriggs East, Westerhill. No severance issues.	Increases accessibility by PT, realising key benefits for those without access to a private car. Offers increase in PT network coverage and sustainable access to key services, employment and facilities and provides linkage to rail network. Increases accessibility to development areas e.g. Woodilee. Pockets of deprivation in Kirkintilloch would benefit from increased access to services and employment opportunities. No severance issues.	Increases accessibility by PT, realising benefits for those who choose not to travel by car for their whole journey. Offers no increase in PT network coverage. Increases in traffic on local roads as a result of additional parking may create severance for pedestrians and cyclists.	Increases accessibility by PT, realising key benefits for those without access to a private car or who choose not to travel by car for their whole journey. Offers increase in PT network coverage. Increases accessibility to development areas e.g. Woodilee. No severance issues.	Increases accessibility by PT, realising key benefits for those without access to a private car or who choose not to travel by car for their whole journey. Offers increase in PT network coverage. Increases accessibility to development areas e.g. Bishopbriggs East, Westerhill. No severance issues.

# 5.10 Costs to Government

STAG outlines that the likely net costs of a scheme from the public sector's point of view should be identified. This will enable a comparison with the total benefits of the scheme in order to assess the overall value for money.

Cost to Government refers to all costs incurred by the public sector as a whole, net of any revenues. The total net cost consists of investment costs, operating and maintenance costs, grant/subsidy payments, revenues, and taxation impacts.

### 5.10.1 Capital Costs

Table 5.19, below, provides outline capital cost estimates associated with each Option.

# Table 5.19: Capital Costs

	Capital Cost (based on specified		Optimism Bias		Estimated Timescale for Implementation	
Option	assumptions and estimated uncertainty - / +30%)	Rate	Applied to estimating uncertainty - / +30%	Applied to base cost		
	(£)	%	(£)	(£)		
Option 1 – Do Minimum		Comm	itted Funding		Ongoing	
2 – A803 QBC Package *	630,000 - 1,170,000	44%	907,200 - 1,684,800	1,296,000	36 months	
3 – Kirkintilloch Bus Hub	105,000 - 195,000	44%	151,200 - 280,800	216,000	12 months	
4 – Park & Ride in Vicinity of B757 / KLR	616,000 - 1,144,000	44%	887,040 -1,647,360	1,267,200	12 months	
5a – Park & Ride Adjacent to BRR (served by existing buses)	616,000 - 1,144,000	44%	887,040 - 1,647,360	1,267,200	12 months	
5b – Park & Ride Adjacent to BRR (served by new services)	616,000 - 1,144,000	44%	887,040 - 1,647,360	1,267,200	12 months	
6 – Loop Bus	7,000 – 13,000	44%	10,080 - 18,720	14,400	6 months	
7a – Lenzie Station Parking (Surface Extension)	350,000 - 650,000	66%	581,000 - 1,079,000	830,000	2-3 years	
7b – Lenzie Station Parking (Decking)	1,519,000 - 2,821,000	66%	2,521,540 - 4,682,860	3,602,200	3-5 years	
8a – Woodilee Rail Station (40-50 spaces)	3,199,000 - 5,941,000	66%	5,310,340 - 9,862,060	7,586,200	5+ years	
8b – Woodilee Rail Station (300+ spaces)	4,599,000 - 8,541,000	66%	7,634,340 - 14,178,060	10,906,200	5+ years	
9 – Westerhill Rail Station	2,870,000 - 5,330,000	66%	4,764,200 - 8,847,800	6,806,000	5+ years	

Estimating uncertainty and optimism bias has been built into the cost estimates although do not account for land acquisition, utilities or design. These costs represent high level estimated costs based on the assumptions presented in Appendix B. Further work would be required to develop detailed cost estimates for any options taken forward.

Discussions with East Dunbartonshire Council have indicated that the capital costs of the preferred Option(s) would be funded by the public sector. In relation to the rail-based Options, in particular the Option to increase parking at Lenzie Rail Station, potentially an element of funding may be available via the Scottish Stations Fund which is managed by Transport Scotland. It is unlikely that European Funding would be available.

Table 5.19 also sets out an estimated timescale for implementation associated with each of the options, assuming no protracted local planning issues.

### 5.10.2 Operation and Maintenance Costs

An estimate of operational costs has also been included as part of the economic appraisal although for the bus-based options in particular further discussion would be required with operators.

It is considered that the operating costs associated with the Park & Ride shuttle bus adjacent to the BRR (Option 5), and the loop bus service (Option 6) would cover most direct costs of running a bus such as staff, fuel, tax, a contribution to overheads, a nominal profit margin and an allowance for additional administration costs on the part of operators in organising the operations (assumed approximately £40 per hour), based on experience elsewhere. The operational costs have been calculated as outlined within Table 5.20, Table 5.21 and Table 5.22.

For Option 5, two potential scenarios have been considered: the first considers that all new services would be required to serve the Park & Ride site (Table 5.20), and the second considers that one existing service per hour would be diverted via the new Park & Ride site (Table 5.21).

For the loop bus service, it is assumed that two vehicles per direction are required in the peak periods (four vehicles in total) and one vehicle per direction is required in the off-peak periods (two vehicles in total).

Table 5.20: Operating Costs Associated With Park & Ride Shuttle Bus Service Adjacent to BRR (Option 5) – Assumes All New Services

Operating Period	Service Frequency	Estimated Number of Vehicles Required Per Hour	Estimated Total Number of Operating Hours Per Annum
0630 – 0930 hours, M-F	Every 15 minutes	4	3,200
0930 – 1600 hours, M-F	Every 30 minutes	2	1,600
1600 – 1900 hours, M-F	Every 15 minutes	4	3,200
1900 – 2200 hours, M-F	rs, M-F Every 30 minutes 2		1,600
0630 – 2200 hours, Saturday	Every 30 minutes	2	1,600
		Estim	nated Total Cost: £375k-£425k

Table 5.21: Operating Costs Associated With Park & Ride Shuttle Bus Service Adjacent to BRR (Option 5) – Assumes **Diversion of One Existing Service Per Hour** 

Operating Period	Service Frequency	Estimated Number of Vehicles Required Per Hour	Estimated Total Number of Operating Hours Per Annum	
0630 – 0930 hours, M-F	Every 15 minutes	4 (3 new services)	2,400	

Estimated Total Cost: £250k-£300k				
0630 – 2200 hours, Saturday	Every 30 minutes	3 (1 new service	800	
1900 – 2200 hours, M-F	Every 30 minutes	2 (1 new service	800	
1600 – 1900 hours, M-F	Every 15 minutes	4 (3 new services)	2,400	
0930 – 1600 hours, M-F	Every 30 minutes	2 (1 new service	800	

Table 5.22: Operating Costs Associated With Loc	op Bus Service (Option 6)
---	---------------------------

Operating Period	Service Frequency	Estimated Number of Vehicles Required Per Hour	Estimated Total Number of Operating Hours Per Annum
0630 – 0930 hours, M-F	Every 15 minutes	4	3,200
0930 – 1600 hours, M-F	Every 30 minutes	2	1,600
1600 – 1900 hours, M-F	Every 15 minutes	4	3,200
		Estin	nated Total Cost: £250k-£300k

Measures such as the bus loop service, and potentially the bus-based Park & Ride services, may require an ongoing level of subsidy to sustain their operation. Whilst assumptions have been made in relation to the frequency of bus service provision for the purposes of deriving operational costs, ultimately the level of service will be dictated by commercial viability. Further detailed work on the specification of the services would be required to ascertain the level of support needed. There may be a requirement to "man" the ticket offices associated with new stations. The rail-based Park & Ride options would also be associated with additional operating costs associated with Network Rail's Long Term Operating Charge – a charge that allows Network Rail to recover the efficient maintenance, renewal and repair costs associated with the stations that it owns.

Maintenance costs can be calculated based on experience of similar projects undertaken elsewhere. There would be a requirement to maintain public transport stations, waiting facilities, car parking areas and access routes to an acceptable standard. The maintenance costs associated with individual Options may include, but not be limited to, the following:

- Option 2 there will be the need for occasional road sweeping, winter maintenance and carriageway repairs associated
  with the Quality Bus Corridor measures, but these elements are currently undertaken for the existing corridor. For those
  parts of the corridor where additional lining is required, congestion by-pass lanes or bus lanes for example, there will be
  the occasional need for refreshing / renewing of these lines. Real time information systems, where appropriate, will
  require to be maintained in proper working order. It is considered however that the costs could largely be built into
  existing maintenance regimes.
- Option 3 bus shelters at the new bus hub will require to be cleaned regularly and this could be added to existing contracts at minimal additional cost to the Council, together with general maintenance of signing and lining. Real time information systems and ticketing machines, where appropriate, will require to be maintained in proper working order. Again, it is considered that these costs could largely be covered by existing programmes.
- Options 4, 5, 7, 8 and 9 car parks will require general winter maintenance such as snow clearance and gritting. The car parks will contain lighting which will require ongoing maintenance, together with general maintenance of signing and

lining. There will be maintenance costs associated with new buses required as part of Option 5. Waiting facilities at public transport stops and stations will require to be maintained to an acceptable standard, including, for example, litter removal. CCTV, real time information systems, where appropriate, will require to be maintained in proper working order.

• Option 6 involves a loop bus service with maintenance costs associated with new buses. Waiting facilities at bus stops will require to be maintained to an acceptable standard. For those areas where additional lining is required, for example to mark out bus bays, there will be the occasional need for the refreshing / renewing of these lines.

A summary of annual operational costs over the 60 year appraisal period is presented in Table 5.23 below:

Table 5.23: Estimating Operation and Maintenance Costs associated with Options

Option	Operating Cost <sup>33</sup>	Comments
Do-Minimum	£0	-
2 – QBC Package	£0	Considered that maintenance would be built into
		existing regimes.
3 – Bus Hub in Kirkintilloch	£0	Considered that maintenance would be built into
		existing regimes.
4 – Bus P&R on KLR/B757	£4,800,000	Based on estimate for a manned Park & Ride station
		and associated costs.
5a – Bus P&R on BRR (served by	£4,800,000	Based on estimate for a manned Park & Ride station
existing services)		and associated costs.
5b – Bus P&R on BRR (served by new	£32,640,000	Operating Cost based on estimate for a manned Park
bus services)		& Ride station and associated costs. Option also
		assumes for purchase of new buses (replaced every
		10 years) + bus operating costs.
6 – Kirkintilloch/Lenzie Loop bus	£18,420,000	Operating cost assumes purchase of new buses
		(replaced every 10 years) + bus operating costs.
7a – Increased Parking at Lenzie Station	£600,000	Operating cost assumes car park replacement after
<ul> <li>Surface Level Car Park (100 space)</li> </ul>		25 years.
7b – Increased Parking at Lenzie Station	£0	Assumed decked car park would not require
<ul> <li>Decked Car Park (200 space)</li> </ul>		replacement during appraisal period.
8a – Rail P&R at Woodilee (50 space)	£4,200,000 (unmanned) -	Estimated operating costs for manned and unmanned
	£13,500,000 (manned)	rail stations.
8b – Rail P&R at Woodilee (300 space)	£4,200,000 (unmanned) -	Estimated operating costs for manned and unmanned
	£16,500,000 (manned)	rail stations.
9 – Rail P&R at Westerhill	£4,200,000 (unmanned) -	Estimated operating costs for manned and unmanned
	£16,500,000 (manned) -	rail stations.

# 5.11 Deliverability and Public Acceptability

#### 5.11.1 Deliverability

Deliverability has been a key consideration during the development of the Options. Clearly, any Option which cannot be delivered could not be taken forward.

The Option(s) taken forward should deliver transport measures to address the issues relating to high car ownership and rising levels of traffic and congestion in the study area. Furthermore, Option implementation should involve minimum disruption to the transport network and the travelling public and should also be compatible with potential long-term development strategies within the study area. Construction and operational risks associated with Option implementation should be minimised.

<sup>&</sup>lt;sup>33</sup> Costs have been calculated over a 60 year appraisal period. Costs presented in Table 5.10 are undiscounted, but have been discounted for the purposes of the economic appraisal.

It is considered that each of the Options could, theoretically, be delivered successfully. Specifically in relation to the bus-based Park & Ride Options (Options 4 and 5), future implementation of hard-shoulder running on the M80 (currently understood to be under consideration by Transport Scotland) could enhance the attractiveness of these Options through providing improved journey times and journey time reliability during periods of high traffic volumes.

There are however, certain issues pertaining to deliverability that are worthy of mention:

- Capacity constraints on the rail network to accommodate additional stops associated with the new rail station sites To achieve new rail stations, there could ultimately be a need for more investment (for example to increase the capacity of the track and ensure services do not interrupt Edinburgh-Glasgow services). This may involve widening to four tracks and implementing parallel slow tracks to allow overtaking, which would result in a significant undertaking (with significant additional costs).
- Should either (or, indeed both) of the new station Options be taken forward, the proposed locations should be reviewed against the infrastructure requirements of EGIP Phase 2. If EGIP Phase 2 affects the station design and is a committed scheme by that time, then it would be most cost-effective to defer the new stations to be implemented at or after EGIP Phase 2. Otherwise consideration should be given to making the stations easily modifiable for any EGIP Phase 2 requirements, for example setting the station buildings back from the platform edge and building the platforms from modular elements which allow them to be reduced in width to accommodate future slow lines.
- Resilience on rail network The additional stopping times associated with new rail stations at Westerhill and / or Woodilee would have a detrimental impact on the resilience and capacity of the main Edinburgh - Glasgow rail line and may be viewed negatively / not supported by the rail industry. The level of impact and any associated risk would require to be discussed further with Network Rail and Transport Scotland should these Options be progressed. It is likely that these Options would need to go through the GRIP 4 process for rail investment which is a costly exercise and would not guarantee implementation support. A significant level of further expenditure will be required before a determination on the implementability of these Options can be made, and this may be abortive expenditure.
- Availability of funding Issues relating to the commercial viability and funding of the bus-based Options, in particular the Kirkintilloch loop bus (Option 6), would require to be discussed further with bus operators and SPT. In addition, Scottish Planning Policy published in June 2014 states within Para 277 that "Agreement should be reached with Transport Scotland and Network Rail before rail proposals are included in a development plan or planning application and it should be noted that further technical assessment and design work will be required before any proposed new station can be confirmed as viable."
- Completion of BRR If roadspace priority is afforded to public transport it is possible that there may be adverse impacts on local traffic movements, particularly through already constrained networks, unless the BRR is fully completed.
- Land Acquisition The Option to provide a new rail station at Woodilee would involve building on land which is
  considered to be extremely valuable. Option 4 (bus-based Park & Ride if located in vicinity of KLR) would potentially
  involve building on land which is not owned by East Dunbartonshire Council.
- Access Constraints There is no clear access to a new station at Woodilee and if this option is taken forward, further
  investigation would be required. Considering access through the Woodilee residential area, this may be accessible for
  pedestrians and cyclists, but would involve private vehicles travelling through residential traffic calmed streets, and would
  most likely be unpopular to local residents. A route of this nature would also not be visible from the main road (i.e. the
  KLR) and may therefore be unattractive to potential rail users. Alternatively, access from the KLR or via Calfmuir Road
  would involve significant construction works including potential bridge widening.
- Implementation of other Park & Ride sites The potential Park & Ride facility at Westerhill (Option 5) would perhaps be less effective should the proposed Park & Ride facilities at Robroyston and the M80 Hornshill Junction (North Lanarkshire City Deal bid) be implemented in the future.

## 5.11.2 Public Acceptability

In terms of public acceptability, this Section of the report seeks to anticipate any issues that may arise with implementation of the Options and predict the likely reactions of the general public against each measure. Details of the consultation undertaken during the STAG 1 process are provided within Chapter Two, and a summary of the consultation process undertaken to inform the STAG 2 is provided within Chapter Four. Appendix E contains details of the Workshops undertaken during STAG 2.

Table 5.24 presents a summary of key outcomes from the consultation exercises undertaken as part of STAG 1 and 2, with a specific focus on issues concerning the public acceptability of options.

# Table 5.24: Consultation Outcomes

Ortion		Public Acceptability
Option	Comments Gathered During STAG 1 Consultation	Additional Comments Gathered During STAG 2 Consultation
A803 Quality Bus Corridor Package	Implementation of the measures associated with the A803 QBC are only likely to be publically acceptable upon full completion of the BRR. If roadspace priority is afforded to public transport as part of these measures, there is a chance that some may question any adverse impacts on local traffic movements, particularly through already constrained networks.	Due cognisance to be given to HGV access and parking (particularly for the mobility implemented. Likely to be greater public acceptability to this Option if sections of bus operational at peak times and at key pinch points. Generally considered that any implemvironment would be welcome. General appetite for this Option amongst bus operators and transport bodies. If Option achieves reduced congestion levels through Bishopbriggs, it would have a pwhich would increase public acceptability.
Bus Hub in Kirkintilloch	A bus hub in Kirkintilloch is likely to be popular with communities. However, interface with parking and traffic flow would need to be considered further, and deem if these issues may affect overall acceptability.	Generally considered that simpler measures such as improved shelters and facilities general creation of a more pleasant waiting environment would add greater value. Some concern that people would not like to walk further to a hub. Bus operators highlighted that essentially there are already two existing informal bus coming from/leaving to Glasgow: Catherine Street and Townhead, respectively. Care should be taken to ensure that any Option does not encourage people to travel elsewhere, thus having a negative impact on the economic vitality of the town centre.
Bus Park & Ride in vicinity of B757 / KLR	No significant public acceptability issues are anticipated provided it does not generate additional traffic on local residential streets.	No significant public acceptability issues expected. Localised objections to Park & Ride expected depending on site selection. If modal shift was achieved, it was anticipated that this Option would help to mitigate publically acceptable. Option generally felt to be attractive (particularly by bus operators and transport bodi Option considered attractive for commuter trips, but noted that non-peak time service
Bus Park & Ride adjacent to BRR	No significant public acceptability issues are anticipated provided it does not generate additional traffic on local residential streets.	No significant public acceptability issues expected. Localised objections to Park & Ride expected depending on site selection. This Option could be a driver of economic development at Westerhill and may attract gain public support. Considered that this Option may ease congestion through the A803 as it may attract Lennoxton, Torrance, Milton of Campsie) who are travelling into Glasgow. The transfer of trips from car to bus would help reduce congestion on the A803 which Bishopbriggs town centre, reduce parking problems and increase access to locations publically acceptable. However, it was considered that bus journey times between the Westerhill site and G M80 and could not compete with rail, thereby raising concerned regarding the viabilit be implemented on the M80 in the future, this may improve the deliverability of this C
Kirkintilloch / Lenzie Loop Bus	Consultation revealed support for improved local bus services, particularly serving key destinations, including the Woodilee village. This measure may also release parking at Lenzie station by promoting increased sustainable access.	Consultation confirmed support for more local bus services, particularly linking key de address current parking problems at the Station, albeit it was noted that existing buse to Lenzie Station but people continue to drive, so it was felt unlikely that this behavior this Option. It was suggested that the bus loop could help improve access to local amenities, and existing parking issues in the area, may achieve a degree of modal shift from car whi Some concerns expressed regarding commercial viability and funding.

<sup>&</sup>lt;sup>34</sup> "Park & Ride in the SPT Area: Results from 2013 User Surveys" – SPT, 2013.

Consultations with East Dunbartonshire Council have established that all Options are consistent with local policies for the area. Furthermore, consultations with the Kirkintilloch Masterplan team have indicated that the measures to create a bus hub associated with Option 3 would complement wider development proposals for the regeneration of Kirkintilloch town centre.

Transport Scotland and Glasgow City Council have queried the resilience of the rail network to accommodate new rail stations at Westerhill and Woodilee. In addition, SPT has queried the commercial viability of a loop bus service. Further work would be required to establish the feasibility and market demand for these Options, should they emerge as preferred Options.

# 5.12 Summary of Appraisal

#### 5.12.1 Option Summary Tables

This Chapter has considered the key elements of the appraisal summarising the operational aspects and the performance of the appraised options against the five STAG criteria of Environment; Economy; Safety; Integration; Accessibility and Social Inclusion. In addition, consideration has also been given to the Costs to Government, Deliverability and Public Acceptability.

Option Summary Tables have been developed for each Option, as presented below.

# 5.12.2 Option Summary Tables

with associated negative impacts on journey times and journey time reliability. Full construction of the BRR is anticipated to generate induced traffic, which would attract more vehicles into the study area in the longer-term. Insufficient improvements to public transport to support local development. Increased future road congestion, alongside insufficient measures to encourage modal shift away from private car, are key factors which will adversely affect the ability to successfully operate the Do Minimum scenario in the longer-term.

STAG Criteria		Implementabilit	y Appraisal
Criterion:	Supporting Information	Criterion:	Supporting Information
Accessibility & Social Inclusion	Minor impact on walking and cycling access to local services through implementation of committed walking and cycling measures.	Technical	Based on a number of committed schemes and thus considered technically feasible. There may be some disruption during construction of some elements of the Do Minimum, for example BRR. There are no untried technologies, and no associated technical risks, involved in implementation of Do Minimum.
Safety	Danger to pedestrians, cyclists and other drivers mitigated by improved road signage and general improvements for walking and cycling through implementation of committed schemes and Council strategies. Increased safety by reducing queuing traffic through the implementation of schemes such as BRR.	Operational	Increased future road congestion, alongside insufficient measures to encourage modal shift away from private car, are key factors which will adversely affect the ability to successfully operate the Do Minimum scenario in the longer-term.
Economy	An enhanced transport network in the study area (delivered mainly through the BRR) could support economic development through increasing the attractiveness of the area as a place to work and live, and improve the efficiency of freight and business travel. Kirkintilloch regeneration would also be expected to support local development and increase the attractiveness of the town for employment and retail.	Financial	Comprises measures which are committed and have funding secured. Likely to be funded through combination of developer contributions, local authority investment, SPT investment, and potentially Scottish Government support and European Funding. No operating subsidies associated with the Do Minimum.
Integration	Overall neutral impact on integration through implementation of committed schemes	Public Acceptability	Stakeholder consultation highlighted a requirement to manage congestion along the A803 corridor.
	This section identifies	key impacts and tens	sions across the sub-criteria
Environment	It is likely that noise and vibration disturbance from the Do Minimum will no infrastructure. Given the scale of the study area, and the level to which an predicted to be significantly impacted upon. Full construction of the BRR is This would have a detrimental environmental impact associated with incre permanent impacts on the water environment. Ground investigation / earth land take and habitat removal required to accommodate some intervention breeding birds and badgers may be lost or disturbed. The introduction of a on landscape / townscape and visual amenity of the area. Impacts on agri land. Soils are also likely to be impacted where excavation is required, an result in any significant impacts on cultural heritage, however construction	y modal shift will be ac s anticipated to genera ased vehicle emission works create potentia is within the Do Minim a new transport corrido culture are likely to occ d / or earthworks for s	chieved from the development of the Do Minimum, global air quality is not ate induced traffic, which would attract more vehicles into the study area. s. The development of the Do Minimum is not predicted to result in any I for ground contamination and / or creation of pollution leakages. There i um, and subsequently habitat for protected species such as bats, or (the BRR) within the landscape has potential to result in adverse effects cur should new infrastructure result in loss or severance of agricultural ite establishment. Implementation of the Do Minimum is not predicted to
Transport Planr			
Objective:	Description of Objective	Objective:	Description of Objective
TPO 1:	To promote modal shift to sustainable transport modes for trips to key attractors outside of the study area, particularly commuting journeys.	<b>TPO 3</b> :	Improve accessibility by sustainable transport modes to key trip attractors within the study area.
TPO 2:	Improve public transport journey times and journey time reliability through the study area.	TPO 4:	Deliver a transport network that supports improvements to human health and air quality, while minimising the impact on the environment.
TPO 5:	Provide a sustainable transport network that supports local development, regeneration and contributes to the sustainable economic growth of the study area.

Contribution toward th	e Government Purpose: Expected to achiev	e modal	shift and	reduce	the num	ber of	car-based	commute	er trips	through the study ar	ea, with associ	ated positive impacts	
	urney time reliability. Improvements to public t												

benefits for local residents and business travel, including Bishopbriggs East, Strathkelvin Retail Park, Westerhill and the surplus Bishopbriggs Academy site (when developed). A reduction in volumes of car-based trips would have a positive impact on air quality and human health. Could also reduce the number of road casualties by removing cars from the road network, but this effect will depend on the degree of modal shift generated from private modes. Integrates well with the wider transport network through providing the potential for improved information, ticketing and signalling technology, together with a range of bus priority measures, and improved access for pedestrians and cyclists. Accords well with transport planning policy, however will enhance existing levels of service provision and will not serve any new land-use areas.

East Dunbartonshire Part 2 Transport Appraisal – Kirkintilloch/Lenzie-Bishopbriggs-Glasgow Corridor Study

STAG Criteria		Implementability Appraisal							
Criterion:	Supporting Information	Criterion:	Supporting Information						
Accessibility & Social Inclusion	Increases accessibility by PT, realising key benefits for those without access to a private car or who choose not to travel by car for their whole journey. Offers enhanced service provision but no increase in PT network coverage. Increases accessibility to development areas. No severance issues.	Technical	This proposal is considered to be technically feasible, with no untried technologies. There may be disruption to traffic during implementation of the QBC measures.						
Safety	Would potentially smooth out traffic flow and reduce link speeds, with beneficial impact on PIAs. Road casualties could be reduced dependent on degree of modal shift from private car. Mitigating facilities would be designed into scheme development to address personal security concerns of many individuals.	Operational	If road space priority is afforded to public transport it is possible that there may be adverse impacts on local traffic movements, particularly through already constrained networks, unless Phases 4 and 5 of the BRR are completed. Requires PT patronage levels to at least be sustained in order to be commercially viable and operate successfully over projected life. Should additional buses be required, there will be associated operational costs. Requirement to maintain the QBC measures.						
Economy	Development of a QBC with associated bus priority would be expected to improve journey time reliability for users of the A803, delivering benefits for local resident and business travel and contributing to local economic development. Option has a positive impact in TEE terms, with traffic time savings generated for public transport users who will benefit from improved bus journey times, and also highway users who will experience travel time savings associated with reduced congestion.	Financial	Option would likely be funded through a combination of local authority investment, SPT funding, local bus operator funding and Scottish Government funding.						
Integration	QBC measures expected to improve integration between modes and reduce car use. Will enhance existing levels of service provision but not serve new land-use areas. Promotion of sustainable transport is in line with Government policies relating to transport and beyond.	Public Acceptability	Likely to receive support from key stakeholders, pending full completion of BRR. Some may question adverse impacts on local traffic movements if road space priority afforded to PT, particularly through already constrained networks. Likely to be greater public acceptability if bus lane sections did not overly penalise motorists e.g. only operationa at peak times and at key pinch points. Generally considered any improvements to bus service provision and waiting environment would be welcome. General appetite for this Option amongst bus operators and transport bodies.						
	This section identifies	key impacts and tens	ions across the sub-criteria						
Environment	Environmental impacts across the ten sub-criteria are generally considered have significant impacts. Smoother traffic flows expected to have a neglic (including impact on biodiversity) and the conditions within the Bishopbrig is not predicted to be significant.	gible (positive) impact o	on local air quality which would benefit the area local to the A803 corridor

**Contribution toward the Government Purpose:** Delivery of an integrated bus hub with associated facility enhancements in Kirkintilloch could increase the attractiveness of bus services in the area and support wider regeneration plans for the town. Associated measures such as pedestrian and cycling access improvements and information improvements would make it easier for bus users to access services. However, unlikely to have a significant impact on journey times or journey time reliability and no increase in public transport coverage. Bringing all services into one area with associated access improvements should reduce traffic congestion in the town centre and support local air quality improvements. May have a marginal impact on economy of Kirkintilloch through reduced congestion and improved accessibility through the town centre attributable to the rationalisation of bus stops. Small pockets of deprivation in Hillhead and, to a lesser degree, Lennoxtown, may benefit, primarily by virtue of increased accessibility to job and labour market opportunities being created within and outside the study area.

East Dunbartonshire Part 2 Transport Appraisal – Kirkintilloch/Lenzie-Bishopbriggs-Glasgow Corridor Study

STAG Criteria		Implementabil	ity Appraisal
Criterion:	Supporting Information	Criterion:	Supporting Information
Accessibility & Social Inclusion	Offers enhanced service provision but no increase in PT network coverage. Increases accessibility to development areas e.g. Woodilee. Pockets of deprivation in Kirkintilloch would benefit from increased access to services and employment opportunities. No severance issues.	Technical	This proposal is considered to be technically feasible, with no untried technologies. There may be disruption to traffic during implementation of the bus hub facility.
Safety	Anticipated small reduction in traffic congestion due to integration of bus stops. Neutral effect on PIAs as no notable increase in PT mode share expected. Mitigating facilities would be designed into scheme development to address the personal security concerns of many individuals.	Operational	Requirement for general maintenance of signing and lining, cleaning of bus shelters etc., which could form part of existing contracts. RTI systems and ticketing machines, where appropriate, will require to be maintained in full working order.
Economy	An interchange point at Kirkintilloch would link more bus services with the town centre, opening up employment opportunities and access to town centre retail. The development of enhanced facilities would also be expected to support the regeneration proposals for the town.	Financial	Option would likely be funded through a combination of local authority investment, SPT funding, local bus operator funding and Scottish Government funding.
Integration	Enhances integration between walking, cycling and bus modes. Supports wider regeneration plans for Kirkintilloch. Improves accessibility for socially excluded and those without car access. Promotion of sustainable transport is in line with Government policies relating to transport and beyond.	Public Acceptability	Generally considered that simpler measures such as improved shelters and facilities, real time information at bus stops and the general creation of a more pleasant waiting environment would add greater value and would be welcomed by the public. Bus operators highlighted there are already two informal bus hubs in Kirkintilloch.
Environment	Kirkintilloch is a culturally sensitive area, bounded by the Antonine Wa Area and Townscape Protection Area with a high density of listed build greatest impacts on cultural assets will be during construction. Increas directly impact these assets, resulting in an overall moderate negative salmonid waters. Where impacts may be experienced during the cons and overall minor negative impact is expected. Development of a cent near vicinity of its location, with overall minor negative impact. The imp	all WHS (north) and to dings. Provided any r sed vibration from hea impact. The River Ke struction, it is predicted ral hub is likely to brin	tensions across the sub-criteria the Forth and Clyde Canal SAM (south). **Contribution toward the Government Purpose:** A bus-based Park & Ride facility would be expected to encourage modal shift from car to bus for journeys leaving the study area, with resultant positive impacts on journey times and journey time reliability within the study area. However, locally, there may be some negative environmental impacts associated with land-take and the generation of local traffic to access the Park & Ride. Could open up opportunities to connect the study area with the strategic road network, which in turn would facilitate travelling to and from major areas of employment and a variety of land uses in the wider area including shopping, employment and transport. However, depending on the location of any future possible facility, there is a risk that a Park & Ride site outwith the town centre could have a negative economic impact on the local town associated with a displacement of trips. It is expected that the Park & Ride facility would integrate with residential properties located to the east of the KLR, and would support wider regeneration plans for the town.

East Dunbartonshire Part 2 Transport Appraisal – Kirkintilloch/Lenzie-Bishopbriggs-Glasgow Corridor Study

STAG Criteria		Implementability Appraisal								
Criterion:	Supporting Information	Criterion:	Supporting Information							
Accessibility & Social Inclusion	Increases accessibility by PT, realising key benefits for those without access to a private car or who choose not to travel by car for their whole journey. Offers increase in PT network coverage. Increases accessibility to development areas e.g. Woodilee. No severance issues.	Technical	This proposal is considered to be technically feasible, with no untried technologies. There may be disruption to traffic during construction of the Park & Ride facility.							
Safety	Could reduce number of road casualties by removing cars from road network, dependent on degree of modal shift from car. Mitigating facilities would be designed into scheme development to address personal security concerns of many individuals.	Operational	Requires PT patronage levels to at least be sustained in order to be commercially viable and operate successfully over projected life. Should additional buses be required, there will be associated operational costs. Ultimately service level will be dictated by commercial viability. Future implementation of hard-shoulder running on the M80 (understood to be currently considered by TS) could enhance deliverability through providing improved journey times and journey time reliability during periods of high traffic volumes.							
Economy	Option would be expected to reduce traffic delays and contribute to economic benefits through improving the efficiency of people and goods flows through the corridor. TEE analysis indicates that the main benefits generated under this option are travel time savings primarily for road users associated with reduced levels of congestion/traffic queuing within the study area due to the transfer of trips to public transport.	Financial	Option would likely be funded through a combination of local authority investment, SPT funding, local bus operator funding and Scottish Government funding.							
Integration	Encourages transfer of trips from car to bus. Integrates with residential development at Woodilee and to east of KLR. Promotion of sustainable transport is in line with Government policies relating to transport and beyond.	Public Acceptability	No significant public acceptability issues expected although there may be localised objections depending on site selection. If modal shift was achieved, this Option could help to mitigate rail overcrowding issues, thereby being publically acceptable.							
	This section identifies	key impacts and tens	ions across the sub-criteria							
Environment	The proposed site in the vicinity of the KLR is within / immediately adjacer residential areas and a long-distance pathway and Core Path along the Bo Area and Townscape Area, however is located in an area adjacent to field of these locations there may be a moderate negative impact on landscape vibration, it is likely that a greater number of receptors will be impacted fro dependent on the detailed alignments, elevations, topography and any po be moderate negative. **Contribution toward the Government Purpose:** A bus-based Park & Ride facility would be expected to encourage modal shift from car to bus for journeys leaving the study area, with resultant positive impacts on journey times and journey time reliability within the study area. However, locally, there may be some negative impacts associated with land-take and the generation of local traffic to access the Park & Ride. Positive economic impacts would be anticipated associated with increasing the accessibility of Westerhill Business Park. Provides an opportunity to lock-in the benefits associated with the development of the BRR. Could open up opportunities to connect the study area with the strategic road network, which in turn would facilitate travelling to and from major areas of employment and a variety of land uses in the wider area including shopping, employment and transport. Could integrate with existing and proposed residential developments in Bishopbriggs.

<sup>&</sup>lt;sup>35</sup> Lower PVC reflects assumption that Park & Ride would be served by existing bus services, whereas high PVC reflects the additional operating costs that are assumed with delivery of a Park & Ride served by new bus services.

East Dunbartonshire Part 2 Transport Appraisal – Kirkintilloch/Lenzie-Bishopbriggs-Glasgow Corridor Study

STAG Criteria		Implementability Appraisal						
Criterion:	Supporting Information	Criterion:	Supporting Information					
Accessibility & Social Inclusion	Increases accessibility by PT, realising key benefits for those without access to a private car or who choose not to travel by car for their whole journey. Offers increase in PT network coverage. Increases accessibility to development areas e.g. Bishopbriggs East, Westerhill. No severance issues.	Technical	This proposal is considered to be technically feasible, with no untried technologies. There may be disruption to traffic during construction of the Park & Ride facility.					
Safety	Could possibly reduce number of road casualties by removing cars from road network, but dependent on degree of modal shift. Mitigating facilities would be designed into scheme development to address the personal security concerns of many individuals.	Operational	Requires PT patronage levels to at least be sustained in order to be commercially viable and operate successfully over projected life. Shou additional buses be required, there will be associated operational costs Ultimately service level will be dictated by commercial viability.					
Economy	Option would be expected to improve access to Westerhill Business Park and the major employers in this area would be expected to support further economic development of this area. TEE analysis indicates that the main benefits generated under this option are travel time savings primarily for road users associated with reduced levels of congestion/traffic queuing within the study area due to the transfer of trips to public transport.	Financial	Future implementation of hard-shoulder running on the M80 (understood to be currently considered by TS) could enhance deliverability through providing improved journey times and journey tim reliability during periods of high traffic volumes. Option would likely be funded through a combination of local authority investment, SPT funding, local bus operator funding and Scottish Government funding. There could be an opportunity for developer contributions.					
Integration	Encourages transfer of trips from car to bus. Integrates with existing/proposed residential development. Provides sustainable access to Westerhill. Promotion of sustainable transport in line with Government policies relating to transport and beyond.	Public Acceptability	No significant public acceptability issues expected. This Option could be a driver of economic development at Westerhill and may attract other businesses into the area, which would gain public support.					
Environment	This section identifies key in Minor positive impact on local air quality through the promotion of sustainable r of earthworks and land-take. There may be effects on visual amenity however of Westerhill Business Park and the BRR to the west of this location, the Park & negative impact. This Option is proposed in an area that is predominantly utilist supporting 'mixed agriculture'. Therefore, any land-take would result in a minor vicinity of the proposed site is the Category C listed building at Cadder Yard. An Option, and an overall minor negative impact may be encountered. The impact	modes of transpor these are depend & Ride would be m ed for agricultural negative impact on n impact on this b	t. Minor negative impact on geology and biodiversity depending on exter ent on the location and design of the scheme, and given the developmen nostly in keeping with the surrounding area, resulting in an overall minor purposes, and land is regarded as being of Class 3.2 – capable of on agriculture and soils. In terms of cultural heritage, within the near uilding is unlikely but dependent upon the final location and design of the

Contribution toward th	e Government Purpose: This option is desig	ned to in	norove ad	ccess to	kev trip	attractor	s within th	ne studv :	area by	public transport, a	nd will benefit t	he local population in

**Contribution toward the Government Purpose:** This option is designed to improve access to key trip attractors within the study area by public transport, and will benefit the local population in particular with some potential modal shift impacts, albeit this is not expected to be significant. By linking key locations within the study area (particularly around Lenzie and Kirkintilloch), this option has potential to support local development and promote local economic growth and access to residential, employment and retail sites. However, this may be negated if a loop bus service opens up the local economy of Kirkintilloch to more competition through improving access to the rail network and associated wider economic centres. It is anticipated that the small pockets of deprivation in Hillhead and, to a lesser degree, Lennoxtown, will seek to benefit from the transport improvements, primarily by virtue of increased accessibility to job and labour market opportunities being created within and outside the study area. Issues relating to commercial viability may affect the ability to successfully operate this option.

East Dunbartonshire Part 2 Transport Appraisal – Kirkintilloch/Lenzie-Bishopbriggs-Glasgow Corridor Study

STAG Criteria		Implementabili	ty Appraisal
Criterion:	Supporting Information	Criterion:	Supporting Information
Accessibility & Social Inclusion	Increases PT network coverage and sustainable access to key services, employment and facilities and provides linkage to rail network. Increases accessibility to development areas e.g. Woodilee. Pockets of deprivation in Kirkintilloch would benefit from increased access to services and employment opportunities. No severance issues.	Technical	This proposal is considered to be technically feasible, with no untried technologies.
Safety	Could reduce number of road casualties by removing cars from road network, but dependent on degree of modal shift. Mitigating facilities would be designed into scheme development to address the personal security concerns of many individuals.	Operational	Requires a minimum level of patronage to at least be sustained in order to be commercially viable and operate successfully over projected life. There will be operational costs associated with buses required for the loop bus. Ultimately service level will be dictated by commercial viability.
Economy	The option could increase the attractiveness of public transport and improve local access to retail and employment opportunities. However, overall impact on economic development is expected to be negligible.	Financial	Option would likely be funded through a combination of funding from local authority, SPT, local bus operator and Scottish Government. There is also potential for developer contributions, and possibly funding from local businesses. There will be operational costs associated with loop bus service.
Integration	Enhances bus – rail integration, linking key land use destinations. Improves accessibility for socially excluded and those without car access. Promotion of sustainable transport in line with Government policies relating to transport and beyond.	Public Acceptability	Support for more local bus services linking key destinations to Lenzie Station. Coupled with existing parking issues, this may achieve modal shift from car which would be acceptable. Concerns expressed regarding commercial viability and funding.
Environment	Changes to service patterns on existing routes are unlikely to have notable on modal shift and therefore impact on air quality and noise and vibration	e impacts across the s	sions across the sub-criteria sub-criteria. Very local measure, therefore unlikely to significantly impact egligible / neutral.
Transport Plan Objective:	ning Objectives Description of Objective	Objective:	Description of Objective
TPO 1:	To promote modal shift to sustainable transport modes for trips to key attractors outside of the study area, particularly commuting journeys.	TPO 3:	Improve accessibility by sustainable transport modes to key trip attractors within the study area.

TPO 5:	Provide a sustainable transport network that supports local development, regeneration and contributes to the sustainable economic growth of the study area.		

**Option 7 Summary Table** East Dunbartonshire Part 2 Transport Appraisal -**Option title: Increased Parking at Lenzie Station** Kirkintilloch/Lenzie-Bishopbriggs-Glasgow Corridor Capital Costs/grant (2010 Prices) Option description: Increase parking provision at Lenzie Rail Station. Two sub-options exist: one based Annual Revenue Support (2010 Prices) on extending the surface car park to the north and the other involving the creation of a new deck over the Present Value (PV) of Cost to Government £2,702,000 existing car parks/railway line. Monetary only Monetary Impacts (Monetary and Non-Monetary) (£m) impact ratio Summary of 0 (if relevant) - - -- --+ ++ +++ impact on the Accessibility and Social Inclusion five STAG Environment criteria Integration Safety Economy -£2,694,000 NPV: BCR: 0.003 NPV(WEB): BCR(WEB): Including Wider Economic Benefits Assessment 0 - - -- --+ ++ +++ against **TPO Target 1:** Transport **TPO Target 2:** Planning **TPO Target 3:** Objectives **TPO Target 4: TPO Target 5:** 

**Contribution toward the Government Purpose:** If this option is successful in promoting increased rail travel and a corresponding decrease in private car use, there is the potential for it to support the re-allocation of road space to public transport, which would bring journey time and reliability improvements. However, this is likely to be balanced by an increase in the number of local car trips (i.e. trips to get to the proposed car park). Option is likely to increase the attractiveness of Lenzie station, which could open up opportunities for increased rail travel and support local development of the area, although any wider economic impacts area likely to be minimal. There are no changes to public transport network coverage associated with this option. Significant environmental impacts are associated with the implementation of this option. Increased parking provision at Lenzie Rail Station may generate more local traffic in populated areas, with associated negative impacts on safety. Does not fit well with policies to promote social inclusion, as option does not enable people who live in socially deprived areas (particularly those with no access to a car) access to the public transport network.

STAG Criter	ia	Implementabil	ity Appraisal
Criterion:	Supporting Information	Criterion:	Supporting Information
Accessibility & Social Inclusion	Increases accessibility by PT, realising benefits for those who choose not to travel by car for their whole journey. Offers no increase in PT network coverage. Increases in traffic on local roads may create severance for pedestrians and cyclists.	Technical	Considered to be technically feasible, with no untried technologies. Possible disruption to traffic during construction of the extended car park facility. Construction of a raised car park adjacent to or over a live railway is technically challenging.
Safety	Could reduce number of road casualties by removing cars from road network, but dependent on degree of modal shift. Rail considered safer than car. Mitigating facilities would be designed into scheme development to address personal security concerns of many individuals.	Operational	Proposal considered operationally feasible. The extended car park area will require general winter maintenance such as snow clearance and gritting, together with ongoing maintenance of items such as lighting, signing and lining. Where appropriate, CCTV will require to be maintained in proper working order.
Economy	Option may increase the attractiveness of Lenzie station for car users, which in turn could increase rail patronage and open up employment and retail opportunities for residents. In TEE terms, this option generally has a negligible impact in terms of generating benefits, with the primary source of benefits delivered by user charges.	Financial	Option would likely be funded through a combination of local authority investment, SPT funding and Scottish Government funding (potentially to include the Scottish Stations Fund). There are no subsidies required to successfully operate this Option.
Integration	Encourages transfer of trips from car to rail for longer journeys but may be negated by increase in local car trips to station. Improves access to land uses in wider area via rail network. Promotion of sustainable transport is in line with Government policies, but impact negated if parking results in increased traffic on local roads. Maximises use of existing infrastructure.	Public Acceptability	Additional parking could generate more traffic on local roads and have a 'honeypot' effect and this would not be publicly acceptable. Potential reduction of recreational green space associated with extending parking at surface level not supported. Strong opposition to decking due to negative visual impact and being adjacent to a Townscape Protection Area.
	This section identifies key	impacts and tensio	ns across the sub-criteria
Environment	Increased noise and vibration levels are subject to volumes of transport predict impact is expected to be moderate negative. Developing on top of existing facil areas of noise generation closer to the surrounding noise sensitive receptors. Area. There are also a number of other listed buildings located within the Cons negative. The station is surrounded by residential areas and the Lenzie Moss L biodiversity and landscape and visual amenity. **Contribution toward the Government Purpose:** This option would improve access to the rail network. Promoting modal shift could contribute to local air quality improvements as a result of reduced car emissions, and safety through smoothing traffic flow and transferring trips from road to rail (a safer mode). Will help to support local economic development opportunities on the Kirkintilloch / Lenzie – Bishopbriggs – Glasgow corridor, e.g. Woodilee and Kirkintilloch Masterplan area, through a combination of managed congestion brought about by increased accessibility, and improved journey times, through the transfer of trips from road to rail. In addition, this option would have wider economic impacts through improving public transport and accessibility to Glasgow, and other key economic centres located on the Edinburgh – Glasgow and Stirling / Alloa – Glasgow rail line. Fits well with policies to promote social inclusion, by enabling people living in socially deprived areas (particularly those with no access to a car) access to the public transport network. Due cognisance would require to be given to impact on the wider rail network, specifically the EGIP proposals, to ensure effective integration.

AECOM

<sup>&</sup>lt;sup>36</sup> Lower PVC reflects assumption that Park & Ride would be unmanned, whereas the higher PVC reflects the additional operating costs with operating a manned station.

STAG Criteri	a	Implementabil	ity Appraisal
Criterion:	Supporting Information	Criterion:	Supporting Information
Accessibility & Social Inclusion	Increases accessibility by PT, realising key benefits for those without access to a private car or who choose not to travel by car for their whole journey. Offers increase in PT network coverage. Increases accessibility to development areas e.g. Woodilee.	Technical	Considered to be technically feasible although constructing a station adjacent to a live railway is challenging. If taken forward, consideration should be given to making the stations easily modifiable for any EGIP Phase 2 requirements.
Safety	Could possibly reduce number of road casualties by removing cars from road network, but dependent on degree of modal shift from private car. Rail is considered a safer mode than car. Mitigating facilities would be designed into scheme development to address the personal security concerns of individuals.	Operational	Resilience on rail network is key risk to successful operation of this Option: additional stopping times associated with new station at Woodilee would impact on resilience of rail network. The level of impact and any associated risk would require to be discussed further with NR and TS should Option be progressed.
Economy	Option would connect a key residential area such as Woodilee with major trip generators, including Glasgow and Edinburgh, opening up employment opportunities in the study area as a result of reduced commuting times. TEE analysis indicates that the major benefits derived with this option is travel time savings for road users, associated with a reduction in congestion on the local road network due to an increase in public transport users linked to a new rail station at Woodilee.	Financial	Likely to be funded through combination of funding from local authority, SPT, Network Rail and Scottish Government. Also potential for developer contributions. SPP14 (Para 277) states "further technical assessment and design work will be required before any proposed new station can be confirmed as viable."
Integration	Encourages transfer of trips from car to rail. Improves access to land uses in wider area via rail network. Promotion of sustainable transport is in line with Government policies, but impact negated if increased parking results in increased traffic on local roads. Land safeguarded in Local Plan 2.	Public Acceptability	General support. Lenzie residents may welcome additional station at Woodilee to alleviate overspill parking impacts from Lenzie station. Deliverability and capacity constraints associated with implementing station on E–G rail line.
Environment	Moderate negative impact on noise and vibration given close proximity to Wo dependent on anticipated increases of traffic volumes within the area. To acc screening the railway track to the south, and there may also be wider impacts Area and Townscape Area and a long-distance pathway and Core Path along moderate negative impact on landscape and visual amenity, and a minor imp Bothlin Burn from oils and fuels leaking from parked vehicles (minor negative space and proximity to Ancient Woodland may have a minor negative impact negative impact from land take or potential contamination of soils, dependent	odilee residential area ommodate the rail sta on visual amenity de g the Bothlin Burn are act on cultural heritag impact); ground cont on biodiversity. The a	ation there will likely be the requirement to remove some trees currently epending on the final scale of the scheme. AECOM

<sup>&</sup>lt;sup>37</sup> Lower PVC reflects assumption that Park & Ride would be unmanned, whereas higher PVC reflects the additional operating costs with operating a manned station.

STAG Criteria		Implementabilit	y Appraisal
Criterion:	Supporting Information	Criterion:	Supporting Information
Accessibility & Social Inclusion	Increases accessibility by PT, realising key benefits for those without access to a private car or who choose not to travel by car for their whole journey. Offers increase in PT network coverage. Increases accessibility to development areas e.g. Bishopbriggs East, Westerhill.	Technical	Considered to be technically feasible although constructing a station adjacent to a live railway is challenging. Consideration should be giver to making the stations easily modifiable for any EGIP Phase 2 requirements.
Safety	Could possibly reduce number of road casualties by removing cars from road network, but dependent on degree of modal shift from private car. Rail is considered a safer mode than car. Mitigating facilities would be designed into scheme development to address the personal security concerns of individuals.	Operational	Resilience on rail network is key risk to successful operation of this Option: additional stopping times associated with new station at Woodilee would impact on resilience of rail network. The level of impact and any associated risk would require to be discussed further with NR and TS should Option be progressed.
Economy	The option would connect a key employment area such as Westerhill with the rail network, and could have wider economic impacts in the future. Analysis of TEE indicates that the primary source of benefits associated with a new rail station at Westerhill is travel time savings with benefits delivered for both road and public transport users. Road users benefit due to an estimated reduction in local traffic and congestion associated with increased numbers using public transport. Benefits for public transport users are generated through faster travel times associated with the provision of a new rail station in this location.	Financial	Likely to be funded through combination of funding from local authority SPT, Network Rail and Scottish Government. Also potential for developer contributions. SPP14 (Para 277) states "further technical assessment and design work will be required before any proposed new station can be confirmed as viable."
Integration	Encourages transfer of trips from car to rail. Improves access to Westerhill Business Park and land uses in wider area via rail network. Promotion of sustainable transport in line with Government policies, but impact negated if results in increased traffic on local roads. Land safeguarded in Local Plan 2.	Public Acceptability	General support. Attractive for established business and increased accessibility may generate economic development, which would be acceptable. Could alleviate parking problems in Bishopbriggs centre, with positive impact on air quality, thus gaining public support. Deliverability and capacity constraints associated with implementing station on E–G rail line.
Environment	This section identifies Moderate negative impact on noise and vibration given close proximity to operation, dependent on anticipated increases of traffic volumes within the potentially some woodland areas, with associated impacts on landscape a ecological corridor by East Dunbartonshire Council and construction in thi geology during earthworks. Potential negative impact on Category C liste	Bishopbriggs East resi e area. To accommoda and visual amenity, and s area may have a neg	ate the rail station there will likely be a loss of agricultural land, and d agriculture and soils. The railway line is identified as an important gative impact on biodiversity. Potential ground contamination / impact on

6 Monitoring and Evaluation

# 6 Monitoring and Evaluation

#### 6.1 Introduction

The Scottish Government requires monitoring and evaluation to be undertaken and documented for any proposal for which it provides funding or approval.

STAG requires that a new project or strategy be subject to planned evaluation and monitoring, in addition to regular revalidation throughout its development.

Monitoring is an ongoing process of watching over the performance of a project identifying problems as these arise and taking appropriate action, whilst Evaluation is used for specific, post-implementation events, designed to assess the project performance against established objectives and to provide in-depth diagnosis of successes as well as deficiencies. Therefore, by gathering and interpreting information, monitoring and evaluation will demonstrate how the project or strategy performs against its objectives, identify any deficiencies and allow adjustments to be made.

Soon after implementation, the performance of the scheme should be assessed against the specified objectives. Recognising that certain projects require time before the full benefits can be realised, a further evaluation is required some time after implementation.

In addition, regular monitoring of the scheme is essential against specified Key Performance Indicators (KPIs) to assess the ongoing effectiveness of the overall strategy and individual schemes.

This Chapter describes the measures which may be put in place by East Dunbartonshire Council to meet the requirements of the STAG with respect to evaluation and monitoring. An indicative monitoring process is indicated in Figure 6.1.

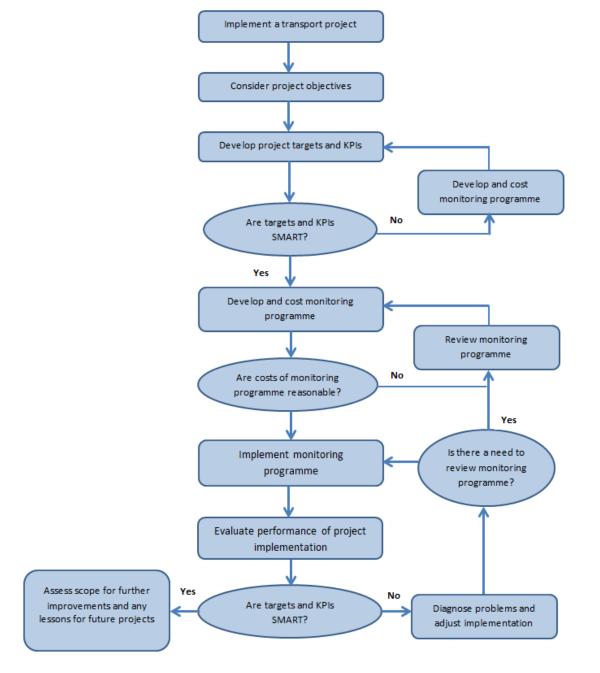

Figure 6.1 – Indicative Monitoring Process

#### 6.2 Objectives

#### 6.2.1 Introduction

The objectives for the study are described in Chapter Two of this report and further refined within Chapter Five. The specific project objectives have been derived from a range of national and local policies reflecting transport and more diverse government and local authority strategies. The project objectives have also been developed to address the problems in the area and take on board the aspirations of stakeholders.

#### 6.2.2 Strategy Objectives

The specific project objectives developed for the study, and against which the various proposals will be evaluated and monitored, are as follows:

- Promote modal shift to sustainable transport modes for trips to key attractors outside of the study area, particularly commuting journeys.
- Improve public transport journey times and journey time reliability through the study area.
- Improve accessibility by sustainable transport modes to key trip attractors within the study area.
- Deliver a transport network that supports improvements to human health and air quality, while minimising the impact on the environment.
- Provide a sustainable transport network that supports local development, regeneration and contributes to the sustainable economic growth of the study area.

## 6.3 Base Case

It is considered premature to be prescriptive in terms of the establishment of the collection and organisation of the data that will provide the Base Case. It is anticipated that this will be developed and agreed with East Dunbartonshire Council, Transport Scotland, SPT, Network Rail and bus operators, as appropriate, during the period immediately prior to completion / operation of each individual element of the preferred Option.

It is likely that the baseline data may include, but will not necessarily be limited to:

- Data on noise, water quality, air quality, ecology etc.;
- Pedestrian, cyclist and public transport activity along sections of the study area which will be affected by the proposals;
- Junction performance, queue lengths, etc. at critical locations;
- Mode choice surveys; and
- Safety records.

It will be important to establish through discussions with other organisations (for example the neighbouring local authorities (Glasgow City Council and North Lanarkshire Council), train and bus operators) what information is available as part of their regular data gathering functions at that time, to avoid incurring additional cost and to limit the collection of new information to that which is strictly necessary to establish performance against scheme objectives.

It is also noted that it may be necessary to obtain some baseline data prior to start of construction to be certain that construction activities do not adversely impact the validity of any changes measured.

## 6.4 Project Development, Procurement and Construction

#### 6.4.1 Project Validation

It is possible that circumstances may change within the time required for scheme development, approval and construction, which could affect the assumptions made regarding the proposals. During this time it will be necessary to keep under review the planning objectives, taking into account any changes in the underlying transport situation.

#### 6.4.2 Cost and Revenue and Programme Monitoring

It is recommended that a management team comprising various advisors be appointed to manage the process of monitoring cost and revenue and programme issues throughout the development and construction of the preferred Option(s). The team will thereby evaluate any potential for changes in project costs and associated risks.

#### 6.5 Operations

#### 6.5.1 Process Evaluation

Evaluations are specific post-implementation events designed to identify whether:

- A project has performed as intended (or under or beyond expectations);
- Established objectives have been achieved (fully or partially, and the reasons for any failures); and
- The project continues to represent value for money (also considering actual cost budget).

The Process Evaluation is conducted straight after the implementation. It will draw lessons for on-going implementation and for the design, management and implementation of future projects.

For the reasons given above with respect to Base Case data, it is not possible at this stage to be specific about the nature of the process evaluation. It seems likely at this stage that there will be a need to provide data which will measure changes in the baseline parameters mentioned above such as various environmental parameters, public transport passenger counts, mode choice surveys and junction performance.

Table 6.1, below, summarises a possible example which might be employed as the basis for the process evaluation:

## Table 6.1: Evaluation Performance Indicators

Objective	Performance indicator/measure	Performance target	Source of indicator	Monitoring method and frequency
Costs	Proportion of actual costs over budget	X% of budget exceedance	Project costs	Budget and cost comparison – after implementation
	Proportion of budget allocated to EDC which was actually spent within timescale	X% budget spent by completion	Project costs by time	Project costs by time – after implementation
Views	The extent to which (stakeholder, public) consultation influenced outcomes	Significant number of views taken into account	Consultation process	Qualitative examination of consultation, by group
	Stakeholder's views on how well the project was designed and implemented	Overall positive views	Stakeholder interviews	Qualitative survey results by group – after implementation

Transport	The extent to which model results reflect reality	Traffic diversion Congestion Delays	CSTM12 model and traffic surveys	Comparison between modelled and actual – after implementation and again one year later
Local economy	Actual impact on economic activity	Employment Commerce	Before and after surveys	Comparison between before and one year after implementation, by location and activity

Based upon the planning objectives discussed in Section 6.2, above, the following performance indicators could be appropriate:

- Traffic congestion:
  - o Reduce traffic volume on key routes;
  - o Reduce traffic delays; and
  - o Achieve a volume and mix of traffic within the study area, in line with the existing and future road hierarchy.
- Accessibility:
  - o Improve access to public transport network; and
  - o Improve access to employment opportunities.

Table 6.2 summarises potential performance indicators and a possible monitoring programme.

Table 6.2: Potential Performance Indicators and Possible Monitoring Programme

Objective	Performance indicator	Definition of indicator	Performance target	Source of indicator/target	Monitoring method and frequency
	Access to sustainable transport network	Percentage of population within 400 metres walk distance from a public transport stop/service Public transport use	X% by 2025 X million per year by 2025	Population (from Scottish Census)	Yearly population and distribution updates by ward Continuous monitoring of bus and train ticketing Ongoing public transport / cycle user surveys
Accessibility	Access to employment opportunities	Transport connections to employment and regeneration areas	<ul> <li>X% car use for travel to work (and school) from Census data.</li> </ul>	Travel to Work (and School) Data from Census, or local surveys as appropriate.	Review of Census Travel to Work Data, and other local surveys as appropriate.

Traffic Congestion	Traffic volumes - key routes	Average AM/PM, daily, weekly, monthly and annual traffic volumes on key routes Growth in car traffic	Volume of traffic in line with existing and future road hierarchy	Traffic flow / volume surveys	Ongoing review of permanent/ temporary site automatic/manual traffic count programme EDC roads standards manual
	Journey times	Changes in journey times by road-based public transport	Reduction in journey time through study area by 2025	Journey time surveys	Journey time surveys every 2 years
Environmental Impact	Air Quality	Changes in key indicators of air quality	Meet or exceed the air quality management targets adopted by EDC X% by 2025	Air quality monitoring	Ongoing review of EDC air quality monitoring programme
Economic Impact	Town centre vitality	Changes in town centre footfall and percentage of town centre retail vacancies vs total number of town centre retail units.	Meet or exceed targets adopted by EDC X% by 2025	EDC Development and Regeneration Business and Improvement Plan 2015-18	Quarterly performance indicators as set out within EDC Development and Regeneration Business and Improvement Plans

Before the monitoring programme is agreed upon, consideration must be given to the actual availability of the data, practicalities from collecting new data, its format, whether it will properly reflect the indicators proposed and the cost of obtaining it. Indicators and targets should be subject to regular reviews to ensure that they continue to properly reflect the performance of the project against its objectives, throughout the monitoring period.

# 6.6 Summary

This Chapter has set out the project objectives, together with actions to be taken during the various phases from scheme development through to operation to meet the requirements of the STAG guidance with respect to evaluation and monitoring.

The following Chapter outlines the key risks and uncertainties relating to the study.

7 Risk and Uncertainty

#### 125

# 7 Risk and Uncertainty

#### 7.1 Introduction

Risk management strategies should be adopted throughout the appraisal and implementation stages of proposals in order to ensure that steps have been taken to prevent and mitigate risks and uncertainties. Once reliable estimates of relevant costs are built up, risks are explicitly assessed and quantified, and work to minimise project-specific risks is undertaken, any optimism bias can be reduced.

Once risk factors have been explicitly quantified and valued, adjustment should be made to the costs and benefits in order to calculate risk-adjusted "expected values". An expected value provides a single value for the expected impact of all risks. However, in general, even with a well-developed project, there will remain some risks which cannot be foreseen. In such cases it will not be possible to include these risks in the expected value, so instead a contingency figure should be added in order to take account of possible unanticipated risks.

## 7.2 Optimism Bias

Experience has demonstrated a tendency for insufficient contingency costs or programme time to be made; a phenomenon known as Optimism Bias. The economic analysis in this report has been undertaken using standard optimism bias uplifts (for local authority transport schemes at a 'Programme Entry' stage an OB of 44% should be applied, and for rail projects at a prefeasibility stage without a Quantified Risk Assessment an Optimism Bias of 66% should be applied). Should the preferred Option(s) be progressed towards construction, a plan for the management and mitigation of risk will require to be adopted. This Chapter describes our recommended approach.

#### 7.3 Risk Management Process

STAG states that all risks and uncertainties associated with an Option need to be fully identified and accounted for in the appraisal process. As stated in the HM Treasury Green Book (2003)<sup>38</sup>, in appraisals it is always likely there is some difference between what is expected and what actually happens. This is the consequence of biases unwittingly inherent in the appraisal process, and risks and uncertainties that materialise. As a result, it is important to identify and mitigate risks, and make allowances for Optimism Bias.

The objectives of the risk management process are to:

- Identify risks from all sources;
- Assess the potential likelihood, impact and hence overall significance of those risks, thereby prioritising those most in need of management and mitigation;
- Identify appropriate mitigation strategy;
- Allocate responsibility for management of the mitigation process; and
- Periodically review progress towards mitigation and assess the resultant reduction in the Optimism Bias uplift factor.

# 7.4 Risk Identification

This process will involve inputs from all appropriate stakeholders: in this case, we would recommend that Transport Scotland and SPT be involved in discussions, together with Network Rail and rail and bus operators, as appropriate. A Project Risk Workshop would be useful at an early stage. Prior to the workshop, attendees should be asked to advise areas of potential risk and, from this, a list can be compiled to provide the basis for the discussions.

<sup>&</sup>lt;sup>38</sup> Green Book, Appraisal and Evaluation in Central Government, HM Treasury (2003) <u>http://www.hm-treasury.gov.uk/economic data and tools/greenbook/data greenbook index.cfm</u>

The workshop should assess risks for their potential likelihood and potential impact, in order to develop a priority for mitigation, and also to suggest an initial strategy for mitigation. During this process, further risks may be identified. Following the meeting an extended list can be compiled. This forms the basis of the Risk Register, which can then be circulated for further comment.

# 7.5 Risk Register

The Risk Register should be structured to identify:

- A unique identification reference
- A description of the risk
- The stage of scheme development at which the risk might materialise
  - o Planning;
  - o Procurement;
  - o Construction; and
  - o Operations.
- Elements impacted by the risk
  - o Capital expenditure;
  - o Operating expenditure;
  - o Revenue;
  - o Programme;
  - o Quality;
  - o Functionality;
  - o Approvability; and
  - o Safety.
- The likelihood of realisation of the risk, the likely impact of the risk and hence its significance (a rating for which is derived from the product of likelihood and impact)
  - o Prior to mitigation; and
  - Following mitigation.
- Responsibility for mitigation management
  - o Lead responsibility; and
  - o Support to be provided to task leader.
- Mitigation strategy
- Action taken
- Mitigation factor achieved

The Risk Register would be a living document and subject to regular review and amendment. An initial draft risk register is set out within Table 7.1.

## 7.6 Risks Identified within STAG Appraisal

It is recognised that the identification of risks and uncertainties would form an ongoing process. At this stage, the following risks have been identified:

- Limitations of the CSTM12 modelling whilst the CSTM12 model was considered to be the most fit for purpose tool
  available for the purposes of this study, there may be limitations associated with its use, for example there may be new
  developments which are not included within the model and which may materially impact on the volume of trips. Should a
  preferred Option(s) be taken forward for further consideration, additional modelling may be required.
- Consent risk legal and planning issues, specifically where planning approval or powers are required.
- North Lanarkshire Council is considering a Park & Ride facility at the Hornshill Junction within its City Deal bid, and due cognisance would require to be given to this proposal should Option 4 emerge as the preferred scheme.
- Capacity constraints on rail network to accommodate Park & Ride and rail station sites and additional stops. To achieve
  new rail stations, there could ultimately be a need for more investment (e.g. extra lines to increase the capacity of the
  track and ensure services do not interrupt Edinburgh-Glasgow services). This may involve widening to four tracks, which
  would result in a significant undertaking.
- Availability of funding issues relating to the commercial viability and funding of the bus-based Options, in particular the Kirkintilloch loop bus (Option 6), would require to be discussed further with bus operators and SPT. In addition, Scottish Planning Policy published in June 2014 states within Para 277 that "Agreement should be reached with Transport Scotland and Network Rail before rail proposals are included in a development plan or planning application and it should be noted that further technical assessment and design work will be required before any proposed new station can be confirmed as viable."
- Environment as detailed within Section 5.5, various environmental issues have been identified as part of this study. A separate SEA has also been undertaken.
- Right of Way / Core Path AECOM has consulted East Dunbartonshire's Core Paths / Right of Way interactive mapping
  system which has indicated there is right of way situated to the North of the Westerhill Road Bridge (EGM1/109) which
  may pose a risk in relation to the provision of a new rail station at Westerhill. In addition, there is a Core Path
  (Strathkelvin Railway Path) situated to west of the Woodilee development site parallel to Initiative road, which may pose
  a risk in relation to the provision of a new rail station at Woodilee.
- Mining AECOM has consulted the Coal Authority interactive maps database, which has indicated that the area is classed as a high risk due to mining works. It is not expected that there would be high risks of mineral instability so close to the railway line, but this would require further investigation in due course.
- Completion of BRR If roadspace priority is afforded to public transport it is possible that there may be adverse impacts on local traffic movements, particularly through already constrained networks, if Phases 4 and 5 of the BRR are not completed.
- Resilience on rail network the additional stopping times associated with new rail stations at Westerhill and / or Woodilee would impact on the resilience of the rail network. The level of impact and any associated risk would require to be discussed further with Network Rail and Transport Scotland should these Options be progressed.
- Public acceptability at future consultations.

# 7.7 Risk Register

An indicative risk register – as shown in Figure 7.1 – has been prepared to summarise each of the risks identified, and consider the likelihood and impact of their occurrence. In addition each risk has been categorised when the may occur, some risks are associated with the ability to deliver and implement whilst others are associated with the operation of the option post implementation.

AECOM Transportation

# Table 7.1 – Indicative Risk Register

			RISK	IDENTIFICATION			
	Ris	sk Assessme	nt		Risk Nature		
Category	Risk Risk Likelihood Impact 1-5 1-5 Rating			Risk Description	Deliverability	Operation	
3rd Parties / Stakeholders	5	5	25	Resilience on rail network – the additional stopping times associated with new rail stations at Westerhill and / or Woodilee would impact on the resilience of the rail network. The level of impact and any associated risk would require to be discussed further with Network Rail and Transport Scotland should these Options be progressed.		~	
3rd Parties / Stakeholders	5	5	25	Rail Policy - the introduction of two new rail stations on the main Edinburgh - Glasgow rail line may be viewed negatively / not supported by Transport Scotland / Network Rail / Scottish Government / Rail Operators as it may be seen as detrimental to the resilience and capacity on the line. Implementation of this option will need to be supported by these organisations. It is likely that this option will need to go through the GRIP 4 process for rail investment which is a costly exercise which won't guarantee implementation support. A significant level of further expenditure will be required before a determination on the implementability of this option can be made, this may be abortive expenditure.	~	~	
Funding	4	4	16	Financial Support - Progressing interventions beyond the STAG project will require further funding, either by EDC or their partners. There is a risk the sufficient funds may not be secured, particularly for complex and expensive options.	✓	V	
Land and Compensation	5	4	20	Consent risk - legal and planning issues, specifically where planning approval or powers are required.	$\checkmark$		
3rd Parties / Stakeholders	5	4	20	Significant objections to proposals by stakeholders/public resulting in delays/challenges resulting in increasing costs.	$\checkmark$		

AECOM
-------

Transportation

Commercial (Economic)	4	5	20	Availability of funding - issues relating to the commercial viability and funding of the bus-based Options, in particular the Kirkintilloch loop bus (Option 6), would require to be discussed further with bus operators and SPT. In addition, Scottish Planning Policy published in June 2014 states within Para 277 that "Agreement should be reached with Transport Scotland and Network Rail before rail proposals are included in a development plan or planning application and it should be noted that further technical assessment and design work will be required before any proposed new station can be confirmed as viable."	V	V
Design	4	3	12	Capacity constraints on the rail network to accommodate Park & Ride and rail station sites and additional stops. To achieve new rail stations, there could ultimately be a need for more investment (e.g. extra lines to increase the capacity of the track and ensure services do not interrupt Edinburgh-Glasgow services). This may involve widening to four tracks (especially for Woodilee), which would result in a significant undertaking.	~	~
Asset Management	3	4	12	Completion of BRR - If roadspace priority is afforded to public transport it is possible that there may be adverse impacts on local traffic movements, particularly through already constrained networks, if Phases 4 and 5 of the BRR are not completed.	~	~
Design	2	5	10	Mining - AECOM has consulted the Coal Authority interactive maps database, which has indicated that the area is classed as a high risk due to mining works. It is not expected that there would be high risks of mineral instability so close to the railway line, but this would require further investigation in due course.	~	
General - modelling, stds, legislation, taxation	3	3	9	Limitations of the CSTM12 modelling - whilst the CSTM12 model was considered to be the most fit for purpose tool available for the purposes of this study, there may be limitations associated with its use, for example there may be new developments which are not included within the model and which may materially impact on the volume of trips. Should a preferred Option be taken forward for further consideration, additional modelling may be required.	~	
Construction	3	3	9	Traffic management issues - (Problems with construction sequencing)	~	$\checkmark$
General - modelling, stds, legislation, taxation	2	4	8	North Lanarkshire Council is considering a Park & Ride facility at the Hornshill Junction within its City Deal bid, and due cognisance would require to be given to this proposal should Option 4 emerge as the preferred scheme.	✓	

AECOM
Transportation

Commercial	2	4	8	Procurement - contractual issues affect programme delivery e.g. disputes with Contractors, existing contractual franchises with rail operators.	$\checkmark$	$\checkmark$
Land and Compensation	3	2	6	Right of Way / Core Path - AECOM has consulted East Dunbartonshire's Core Paths / Right of Way interactive mapping system which has indicated there is right of way situated to the North of the Westerhill Road Bridge (EGM1/109) which may pose a risk in relation to the provision of a new rail station at Westerhill. In addition, there is a Core Path (Strathkelvin Railway Path) situated to west of the Woodilee development site parallel to Initiative Road, which may pose a risk in relation to the provision of a new rail station at Woodilee.	~	
3rd Parties / Stakeholders	2	3	6	Difficulties in defining expectations and level of information required from Statutory Consultees impacted by the scheme proposals.	✓	
Construction	2	3	6	Impacts on tourism, local businesses, major events, etc. during construction.	$\checkmark$	
Construction	3	3	9	Non-delivery of the Do Minimum package may impact on the deliverability and operation of options. In particular A803 QBC, rail station at Westerhill and bus Park & Ride at Westerhill.	$\checkmark$	$\checkmark$
Construction	2	3	6	Fibre-optic servicing may need to be moved and replaced to implement an option. This would increase costs significantly.	$\checkmark$	
Commercial (Economic)	3	3	9	Introduction of A803 QBC may require TROs which may restrict access to local businesses which may impact their revenue	✓	$\checkmark$
General - modelling, stds, legislation, taxation	3	2	6	The introduction of an option, particularly the A803 QBC, may increase traffic congestion through Bishopbriggs due to the re- allocation of road space to public transport. This may result in traffic rat running through residential roads to minimise delay. This would result in a loss of local amenity and road safety issues, but would be negated by full implementation of the BRR.		~

#### 7.8 Summary

Consideration of risk and uncertainty is essential throughout project development. In addition to incorporating an initial Optimism Bias adjustment, ongoing requirements have been set out which are necessary to manage risk and uncertainty during project development. The following Chapter presents the key recommendations arising from the STAG Part 2 appraisal.

8 Conclusions

## 8 Conclusions

#### 8.1 Introduction

This Chapter brings together the findings from the STAG appraisal process. A summary of each of the Options followed by recommended next steps.

#### 8.2 Outcomes of the Study

#### 8.2.1 Do Minimum

The Do Minimum comprises all committed schemes within the study area and includes implementation of the BRR (up to and including phase 5); SCOOT; Kirkintilloch Town Centre Regeneration; Parking Strategy and Decriminalised Parking Enforcement; EGIP Phase 1; and the Glasgow City Council City Centre Strategy.

The Do Minimum has provided a base case upon which the "Do Something" Options can be compared.

#### 8.2.2 Option 2 – A803 QBC Package

Development of a QBC package along the A803 performs positively against the transport planning objectives. The Option would seek to improve bus journey times and journey time reliability through the study area and in turn aim to promote modal shift to bus for trips outside of the study area, particularly commuter journeys. If the Option is successful in achieving modal shift, it should support air quality improvements in the air quality management area within Bishopbriggs.

It is considered that this Option may help to support local economic development opportunities through a contribution of managed congestion brought about by increased accessibility and improved journey times particularly along the A803 corridor. This Option may also have wider economic impacts through improving public transport and accessibility to Glasgow. The results of appraisal suggest that this Option would deliver a positive economic impact through improving journey time reliability for users of the A803. Traffic time savings would be generated for public transport users who will benefit from improved bus journey times, and also car users who will experience travel time savings associated with reduced congestion.

In general terms, this Option is unlikely to result in adverse environmental impacts as it involves minimal changes to existing infrastructure. It is expected that this Option would result in a smoother flow of traffic (through modal shift from private car) which would see a reduction in link speeds which should in turn result in a reduction in the number and severity of accidents.

This Option is also expected to have a positive impact on transport integration through improved integration between modes and a reduction in reliance on private car use. This Option also aligns well with policy integration as it would reduce the need to travel through encouraging modal shift and assisting in achieving a healthy, prosperous and inclusive society.

In terms of accessibility and social inclusion, the implementation of this Option would improve bus journey times and journey time reliability for both local trips and also commuter trips to / from Glasgow via the A803, albeit there would be no increase in level of public transport coverage. This Option is expected to have a positive impact in terms of tackling the problem of private car use by encouraging a modal shift towards public transport and sustainable modes of travel and improving accessibility to the public transport network. Whilst this will enhance the level of accessibility for those without the use of a car, existing car users will also be encouraged to leave their cars at home in favour of other modes.

There is a general appetite for this Option amongst bus operators and transport bodies, while broader consultation revealed there would be support for this amongst the travelling public as long as measures did not overly penalise motorists (e.g. only operational at peak times and at targeted pinch points). Concerns have been raised that the provision of priority roadspace to public transport through already constrained networks may have an adverse impact on local traffic movements. However, as shown by previous studies, this is expected to negated by the full implementation of the BRR, and it is the case that implementation of QBC measures along the route could help to lock in the benefits of freed up capacity on the A803 post completion of the BRR.

Overall, it is considered that this option performs strongly in terms of delivery against the transport planning objectives of the study and it is recommended for further consideration.

#### 8.2.3 Option 3 – Kirkintilloch Bus Hub

This Option would generally have a positive impact against the transport planning objectives of this study by improving the integration of bus services, ease of interchange and make travel by bus more attractive. However, the Option is not anticipated to significantly contribute to modal shift.

The implementation of a bus hub in Kirkintilloch may have a marginal impact on the economy of Kirkintilloch through reduced congestion and improved accessibility through the town centre attributable to the rationalisation of bus stops.

The construction of new infrastructure associated with the bus hub may, however, have adverse environmental impacts, specifically Kirkintilloch town centre is located within a Conservation Area and Townscape Protection Area.

It is considered that this Option will have a positive impact on transport integration through improved integration between modes and a reduction in reliance on private car use. This Option is aimed at providing a more attractive bus system within Kirkintilloch, which is likely to attract public transport users to this mode and will support wider regeneration plans for the town. It is further considered that this Option would have a positive impact on policy integration as it would promote sustainability and reduce the need to travel through encouraging modal shift and assisting in achieving a healthy, prosperous and inclusive society.

In terms of accessibility and social inclusion, the development of a bus hub in Kirkintilloch would assist in reducing town centre congestion through the centralisation of bus stop locations, and would improve bus journey times and journey time reliability for local trips, albeit there would be no increase in public transport coverage.

With regards to public acceptability, it was generally considered that simple measures to improve facilities for bus passengers such as improved shelters and facilities, real time information at bus stops and the general creation of a more pleasant waiting environment would add value and would be welcomed by the public.

Overall, it is considered that this option has the potential to deliver local benefits to bus passengers in the area and should be considered as part of future and ongoing masterplanning works for Kirkintilloch town centre.

#### 8.2.4 Option 4 – Bus Park & Ride in the Vicinity of the B757 / KLR

Against the transport planning objectives of this study, a bus-based Park & Ride in this location performs positively. The Option would be expected to support improve the attractiveness of public transport and encourage a shift from car to bus for commuter trips into Glasgow from the Kirkintilloch and Lenzie areas.

It is considered that this Option may help to support local economic development opportunities through a contribution of managed congestion brought about by increased accessibility, and improved journey times particularly along the A803 corridor. The provision of a bus-based Park & Ride facility may have wider economic impacts through improving public transport and accessibility to Glasgow. Analysis of transport modelling indicated that the main benefits generated under this option are travel time savings for car users associated with a reduction in congestion.

The construction of this Option is likely to have some negative environmental impacts. Specifically the site is within / immediately adjacent to the south Lenzie Conservation Area and Townscape Area and adjacent to a pocket of Ancient Woodland listed within the Ancient Woodland Inventory (AWI). This is also surrounded by residential areas and a long-distance pathway and Core Path along the Bothlin Burn, and is located within close proximity to the south Lenzie Conservation Area and Townscape Area and the Gadloch water body.

It is expected that this Option would result in a smoother flow of traffic (through modal shift from private car) and would see a reduction in link speeds which should in turn result in a reduction in the number and severity of accidents. Whilst this Option would encourage people to transfer from cars to bus services for journeys to and from Glasgow, this may be negated by an increase in more local car trips to the Park & Ride and this would require to be considered appropriately at the design stage.

The Park & Ride facility would be expected to integrate with residential properties located to the east of the Link Road (Woodilee), where public transport services are currently limited. It is further considered that this Option would have a positive impact on policy integration as it would promote sustainability and reduce the need to travel through encouraging modal shift and assist in achieving a healthy, prosperous and inclusive society.

In terms of accessibility and social inclusion, the implementation of a bus-based Park & Ride facility could increase the attractiveness of bus as a mode of transport for commuting trips to / from Glasgow and would potentially remove pressure from the rail network and assist in alleviating Lenzie Rail Station parking difficulties.

There are no significant public acceptability issues expected in relation to this Option, albeit there may be localised objections depending on site selection. If modal shift was achieved, it was anticipated that this Option would help to mitigate rail overcrowding issues, thereby being publically acceptable. This Option was generally felt to be attractive by bus operators and transport bodies, particularly if a site is identified which could be used by existing bus services without the need for detour. The proposal would require a minimum level of patronage to at least be sustained in order to be commercially viable and operate successfully over its projected life. The benefits of this option would be enhanced by future implementation of hard-shoulder running on the M80 (understood to be under consideration by Transport Scotland) through providing improved bus journey times and journey time reliability during periods of high traffic volumes. This Option would perhaps be less effective should the proposed Park & Ride facilities at Robroyston and the M80 Hornshill Junction (under consideration by North Lanarkshire Council) be implemented in the future. It is noted that the transport modelling exercise undertaken as part of this study has suggested that the benefits of this option would be reduced in a scenario with the Robroyston Park & Ride facility in place. There would likely be compatibility issues with this option and other Park & Ride proposals.

On the whole, this option performs positively in terms of addressing the transport planning objectives of this study and is recommended for further consideration, pending more detailed site specific investigations.

#### 8.2.5 Option 5 - Bus Park & Ride Adjacent to BRR

Similar to Option 4, the implementation of a bus-based Park & Ride in this location performs positively against the transport planning objectives of this study. The Option would be expected to encourage a transfer of trips from car to bus for commuter journeys from the study area into Glasgow, as well as improving sustainable access to Westerhill Business Park owing to the location of the proposed Park & Ride adjacent to the Business Park. By increasing the accessibility of the Business Park, this Option would also promote local economic growth of the area.

It is considered that this Option may help to support local economic development opportunities through a contribution of managed congestion brought about by increased accessibility, and improved journey times particularly along the A803 corridor. In addition, the provision of a bus-based Park & Ride facility may have wider economic impacts through improving public transport and accessibility. Similar to Option 4, analysis of transport modelling indicated that the main benefits generated under this option are travel time savings for car users associated with a reduction in congestion

The construction of this Option is likely to have negative environmental impacts, specifically the railway line adjacent to the BRR is identified as an important ecological corridor.

It is expected that this Option would result in a smoother flow of traffic (through modal shift from private car) which would see a reduction in link speeds which should in turn result in a reduction in the number and severity of accidents.

It is considered that this Option would have a positive impact on transport integration through improved integration between modes and a reduction in reliance on private car use, however this may be negated by an increase in more local car trips to the Park & Ride facility and this would require to be considered appropriately at the design stage.

The Park & Ride facility is expected to have a positive impact through promoting modal shift for commuting journeys between the study area and Glasgow, and providing access to a variety of land uses in the wider area. It would integrate with existing and proposed residential developments in Bishopbriggs and also offer sustainable access to Westerhill Business Park. It is further considered that this Option would have a positive impact on policy integration as it would promote sustainability and reduce the need to travel through encouraging modal shift and assist in achieving a healthy, prosperous and inclusive society.

In terms of accessibility and social inclusion, this Option could increase the attractiveness of bus as a mode of transport for commuting trips to / from Glasgow and would potentially remove pressure from the rail network and assist in alleviating Lenzie Rail Station parking difficulties.

There are no significant public acceptability issues expected in relation to this Option, albeit there may be localised objections depending on site selection. It is considered that this Option may ease congestion through the A803 as it may attract residents

from more remote communities (i.e. Lennoxton, Torrance, Milton of Campsie) who are travelling into Glasgow. This Option could be a driver of economic development at Westerhill and may attract other businesses into the area, which would gain public support. The transfer of trips from car to bus would help reduce congestion on the A803 which could increase accessibility through Bishopbriggs town centre, reduce parking problems and increase access to locations such as Stobhill Hospital, all of which are publically acceptable. In order to sustain a Park & Ride service in this area, including through the operation of new services or diversion of existing services, there would be a need for a minimum patronage level. Future implementation of hard-shoulder running on the M80 (understood to be under consideration by Transport Scotland) could enhance the attractiveness of this Option through providing improved journey times and journey time reliability during periods of high traffic volumes. It is to be noted however that transport modelling has suggested that the benefits of this option would be significantly reduced in a scenario with the Robroyston Park & Ride facility in place. There would likely be compatibility issues with this option and other Park & Ride proposals.

This option would have a positive impact against the transport planning objectives of the study and is recommended for further consideration, pending more detailed site specific investigations.

8.2.6 Option 6 – Kirkintilloch / Lenzie Loop Bus

Introduction of a loop bus service connecting key locations within the study area would positively contribute towards delivery of the study transport planning objectives. Specifically, this Option may promote a transfer of trips from car to rail for trips outside of the study area by improving the integration between bus and rail (at Lenzie) for those without access to a car. Importantly, the Option would also encourage sustainable travel for trips within the study area through provision of a loop bus service linking key location within Kirkintilloch and Lenzie.

In terms of this Option, it is anticipated that this Option may deliver wider economic impacts through improving public transport access between Lenzie and Kirkintilloch, although this could be negated if its introduction opens up the local economy of Kirkintilloch to more competition through improving access to the rail network and associated wider economic centres.

It is not anticipated that there would be any adverse environmental impacts associated with this option since it would involve minimal changes to existing infrastructure.

In terms of integration criteria, this option performs strongly. A new loop bus service would link Lenzie rail station to a variety of land uses in the local area including shopping, housing, education, employment and transport. Services would also be timetabled to dovetail with rail services at Lenzie Rail Station, thus significantly improving integration between bus and rail modes.

Similarly, with regards to accessibility, the introduction of a loop bus service would increase public transport network coverage and improve access to Lenzie rail station, thereby increasing the number of people able to access local and city centre employment opportunities. Furthermore, the loop bus service would assist in improving access to employment opportunities within Kirkintilloch town centre, both for those who would make the journey entirely by bus and those who would interchange with rail services at Lenzie. Access to other local services would also be improved, which is important in terms of tackling social exclusion and providing sustainable transport access to key services, facilities and employment for those without direct access to a rail station.

Overall, while the option does perform positively against many of the transport planning objectives, there are concerns about the deliverability of this Option primarily on the grounds of its commercial viability. For this reason, it is recommended that this option is not taken further forward at this stage.

#### 8.2.7 Option 7 – Increased Parking at Lenzie Station

Increasing car parking provision at Lenzie Station has the potential to have both positive and negative impacts against the transport planning objectives of the study. The Option would enable more people to use Lenzie Station and thereby increase sustainable access for commuter journeys outside of the study area. However, the Option would also encourage an increase in local car journeys accessing the station, thereby having a negative impact against the objective of increasing the use of sustainable transport for trips within the study area.

In terms of economic impacts, the Option would increase the attractiveness of Lenzie Station, which could open up opportunities for increased rail travel and support local development of the area, although wider economic impacts area likely to be minimal.

The Option is likely to generate an increase in local car trips (i.e. trips to get to the car park) in the populated area around Lenzie rail station, which could lead to possible safety concerns.

From a transport integration perspective, increased parking at Lenzie Station would encourage modal shift from car to rail thus improving the level of integration between the modes for longer journeys. Enhanced access to the rail network would also have a positive impact on land-use integration through improving access to land uses in the wider area.

In terms of the impact on local accessibility, while the option will enhance access for car users to the rail station, the net impact is likely to be neutral due to the impact of increased levels of traffic on local roads negating any accessibility benefits to pedestrians and cyclists.

Unlike other options which were generally considered favourable during public consultation, clear opposition was shown to this Option by a number of stakeholders. In addition to concerns that the additional parking would generate more traffic on local roads and have a 'honeypot' effect which would not be acceptable, concerns were also expressed on environmental grounds. Specifically, a potential reduction of recreational green space associated with extending Lenzie Station parking at the surface level would not be supported, while there was strong opposition to the decking due to its likely negative visual impact adjacent to a Townscape Protection Area.

On environmental grounds, it is recommended that this Option is not considered further and instead opportunities are examined to improve and promote local access to the station by sustainable transport means (i.e. walking and cycling) as an alternative approach to relieving parking pressure at the station.

#### 8.2.8 Option 8 – New Rail Station at Woodilee

Implementation of a new rail station at Woodilee performs positively against the transport planning objectives of the study. The Option would support improved public transport journey times through the provision of a direct rail service from Woodilee and, in turn, strongly contribute to the objective of promoting modal shift for commuter journeys outside of the study area. As a result, this Option would be expected to make a positive contribution towards supporting local development and economic growth of the study area.

Following on from this, against the STAG economy criteria, the provision of a new rail station is likely to have a positive economic impact through a combination of managed congestion brought about by increased accessibility, and improved journey times, through the transfer of trips from road to rail. As alluded to above, this option would also have wider economic impacts through improving public transport and accessibility to Glasgow, and other key economic centres located on the Edinburgh – Glasgow and Stirling / Alloa – Glasgow rail lines. The results of modelling suggest that the main benefits derived with this Option would be travel time savings for road users, associated with a reduction in congestion on the local road network due to an increase in public transport users linked to a new rail station at Woodilee. However, while this option performs positively in economic terms in the Do Minimum situation, transport modelling suggests that in a scenario with Robroyston Park & Ride in place, the Woodilee station option does not perform favourably and is estimated to generate a negative BCR with generated benefits abstracted by the availability of the proposed Robroyston Park & Ride.

Promoting modal shift could contribute to local air quality improvements as a result of reduced car emissions, and safety through smoothing traffic flow and transferring trips from road to rail (a safer mode).

Levels of accessibility would be improved with a new Woodilee station, which by its nature would increase public transport network coverage. Rail demand would be expected to increase leading to an increase in the number of people able to access local and city centre employment opportunities, given the speed and capacity characteristics of rail versus other modes.

From a transport integration perspective, a new Park & Ride station at Woodilee would encourage a transfer from cars to rail services for journeys to and from Glasgow, although this may be negated by an increase in more local car trips to the Park & Ride / new station facility. Due cognisance would also need to be given to the impact of this Option on the wider rail network,

specifically the EGIP proposals, to ensure effective integration which could be challenging. In terms of land use integration, this Option is expected to have a positive impact through promoting modal shift for commuting journeys between the study area and Glasgow, and providing access to a variety of land uses in the wider area. The Option would also integrate well with, and improve accessibility for residential properties located in the new Woodilee development, where public transport services are currently limited.

Stakeholder consultation generally revealed support for the concept of a new rail station with Park & Ride at Woodilee as this could alleviate overspill car parking impacts at Lenzie rail station, although there could be localised objections to Park & Ride depending on the site selected and the access route to the site, which requires further investigation. Concerns have been raised, however, around the acceptability of this option due to potential capacity constraints on the Edinburgh-Glasgow line, and associated impacts of additional stations on wider network resilience. Equally, concern was also raised during consultation that some rail users may use a station at Woodilee instead of other stations in the area (i.e. Lenzie and Bishopbriggs), simply to access trains before other passengers in order to get a seat, thus heightening problems of overcrowding down the line (albeit the EGIP proposals will increase passenger capacity on the line).

Despite the likely positive impacts of a new station at Woodilee, there are a number of deliverability issues which pose significant question marks over this Options feasibility.

Firstly, although rail operation modelling undertaken as part of this study has suggested that it would be theoretically possible to timetable additional stops on the Edinburgh – Glasgow rail network, there are concerns around potential capacity constraints on the rail network to accommodate additional stops such as at Woodilee. To implement a new station would potentially require increasing the capacity of the track to ensure services do not interrupt Edinburgh-Glasgow services. This may involve widening to four tracks and implementing parallel slow tracks to allow overtaking, which would result in a significant undertaking (with significant additional costs).

Secondly, and linked to the above, is the potential impact that a new station would have on wider network resilience. Again, although the rail operational modelling has suggested that it is theoretically possible to fit new stops on the line, the additional stopping times associated with new rail stations at Woodilee would have a detrimental impact on the resilience and capacity of the main Edinburgh – Glasgow rail line and may be viewed negatively / not supported by the rail industry. The level of impact and any associated risk would require to be discussed further with Network Rail and Transport Scotland should these Options be progressed. It is likely that these Options would need to go through the GRIP 4 process for rail investment which is a costly exercise and would not guarantee implementation support. A significant level of further expenditure will be required before a determination on the implementability of these Options can be made, and this may be abortive expenditure.

Additionally, there are concerns about the provision of access to a new station at Woodilee and if this option is taken forward, further investigation would be required. While access through the Woodilee residential area would be appropriate for pedestrians and cyclists, it would involve private vehicles travelling through residential traffic calmed streets, which would meet resistance from local residents. A route of this nature would also not be visible from the main road (i.e. the KLR) and may therefore be unattractive to potential rail users. Alternatively, access from the KLR or via Calfmuir Road would involve significant construction works including potential bridge widening.

Overall, while this Option performs strongly against the overall transport planning objectives of this study and various STAG criteria, there are significant deliverability issues which would require further investigation prior to taking this Option further forward.

#### 8.2.9 Option 9 - New Rail Station at Westerhill

Option 9 is anticipated to perform slightly more positively than Option 8 in terms of addressing the transport planning objectives of the study. Similar to Option 8, a new Park & Ride rail station at Westerhill would encourage modal shift to rail for commuter journeys outside of the study area, but in addition would be expected to contribute more positively to objectives around increasing accessibility to key trip attractors within the study area and supporting local development and economic growth of the study area by improving access by rail to Westerhill Business Park.

In terms of the STAG economic criteria, a new rail station at Westerhill would deliver positive impacts through improving public transport accessibility to Glasgow, and other key economic centres located on the Edinburgh – Glasgow and Stirling / Alloa – Glasgow rail line. As referred to above, a new station in this location would also connect the key employment area of Westerhill Business Park with the rail network, delivering wider economic impacts. Analysis of TEE indicates that the primary source of benefits associated with a new rail station at Westerhill is travel time savings with benefits delivered for both road and public transport users. Road users benefit due to an estimated reduction in local traffic and congestion associated with increased numbers using public transport. Benefits for public transport users are generated through faster travel times associated with the provision of a new rail station in this location. Similar to Option 8, transport modelling indicates that while this Option performs positively in economic terms in the Do Minimum situation, in a scenario with Robroyston Park & Ride in place, the Option does not perform favourably and is estimated to have a negative BCR with generated benefits abstracted by the availability of the proposed Robroyston Park & Ride.

The environmental appraisal suggested this option could have both positive and negative impacts. In safety terms, the option would be expected to have a minor positive impact in reducing the number of road casualties by removing cars from road network, but this would be dependent on degree of modal shift from private car.

A new rail station in this location would improve accessibility by increasing public transport network coverage. Particular benefits would be experienced by residents In Bishopbriggs East and employees at Westerhill Business Park. Rail demand would be expected to increase leading to an increase in the number of people able to access local and city centre employment opportunities, given the speed and capacity characteristics of rail versus other modes.

From a transport integration perspective, a new Park & Ride station at Westerhill would encourage a transfer of trips from car to rail for journeys to/from Glasgow and also to Westerhill Business Park which is an important employer in its own right. In terms of land use integration, this Option is expected to have a positive impact through promoting modal shift for commuting journeys to and from the study area, and promote the further development of the Business Park. The option would also be integrated with the proposal for the BRR, which would be expected to open up the accessibility of the site to residents across the study area. Similar to Option 8, cognisance would require to be given to the impact of this Option on the wider rail network, specifically the EGIP proposals, to ensure effective integration which could be challenging.

Stakeholder consultation revealed support for a new rail station at Westerhill. The option is considered to be attractive for existing businesses in the area while increased accessibility may generate economic development which would be supported. Consultation also revealed the view that a new station in this location could alleviate parking issues in Bishopbriggs town centre which would also have a positive impact on air quality, thus gaining public support. However, similar to Option 8, concerns have also been raised about the deliverability of the scheme due to potential capacity constraints on the Edinburgh-Glasgow line, and associated impacts of additional stations on wider network resilience.

As discussed under Option 8, while rail operational modelling has suggested that it would be theoretically possible to timetable additional stops on the Edinburgh – Glasgow rail network, there are concerns around potential capacity constraints on the rail network to accommodate additional stops such as at Westerhill and its impact on reducing wider network resilience. The level of impact and any associated risk would require to be discussed further with Network Rail and Transport Scotland should these Options be progressed. It is likely that these Options would need to go through the GRIP 4 process for rail investment which is a costly exercise and would not guarantee implementation support. A significant level of further expenditure will be required before a determination on the implementability of these Options can be made, and this may be abortive expenditure.

Overall, similar to Option 8, while the development of a new Park & Ride rail station at Westerhill performs strongly against the overall transport planning objectives of this study and various STAG criteria, there are significant deliverability issues which would require further investigation prior to taking this Option further forward.

#### 8.3 Summary and Recommendations

Results of the transport appraisal indicate that each of the Options have the potential to positively contribute towards the delivery of the transport planning objectives of the study and also perform positively against the majority of the STAG criteria.

Of all the Options assessed the option of increasing parking provision at Lenzie rail station performs least positively given the public concerns around this option, including the potential environmental impacts on the local landscape as well as the potential increase in local car journeys associated with this Option. The Option of delivering a bus hub in Kirkintilloch has the potential to deliver local level benefits but does not significantly contribute towards the wider transport planning objectives of this study, while the Option of improving local accessibility through the provision of a Kirkintilloch/Lenzie loop bus is not considered to be financially viable.

Of the bus-based options (Option 2, 4 and 5), each option is anticipated to support improved bus journey times and in turn increase public transport accessibility and encourage modal shift for commuter journeys. Option 5 would also support modal shift for trips to the study area by improving sustainable access to Westerhill Business Park. The rail-based Park & Ride options (Options 8 and 9) would similarly contribute positively to encouraging modal shift for key trips from the study area, with Option 9 expected to contribute more positively due to the benefits this Option would deliver by increasing the accessibility of Westerhill Business Park and supporting local economic growth.

The results of transport modelling indicate that the bus-based options generate greater positive economic benefit cost ratio than the rail based options, primarily as these options are not as costly as the rail options, while it is also the case that the proposals for new rail stations are associated with significant deliverability issues which would require further discussion with Transport Scotland and Network Rail. The transport modelling also indicated however that the inclusion of a new Park & Ride rail station at Robroyston has a significant detrimental impact on the level of benefits generated by both the bus and rail-based Park & Ride schemes. The exception to the above is the A803 Quality Bus Corridor Package (Option 2) which does not appear to be impacted by the availability of a new Robroyston station and generates positive impacts in a scenario both with and without Robroyston Park & Ride in place.

On the basis of the appraisal, the following recommendations are made:

- Overall, the development of a QBC on the A803 (Option 2) performs strongly against the transport planning objectives of the study, the STAG criteria and is considered to be technically and operationally feasible. Unlike other options, the QBC Option is estimated to deliver benefits under scenarios both with and without the implementation of a new station at Robroyston. By way of next steps, it is recommended that a detailed feasibility study is undertaken to examine the specific QBC measures that could be implemented along the corridor phased with the development of the BRR. This will ensure that the benefits of the BRR are 'locked in' on the A803 and allow partners to put forward the case for investment in bus measures on the A803 as part of future work looking at enhancing the bus quality corridors across Strathclyde.
- The Kirkintilloch Bus Hub (Option 3) does not perform as strongly against the transport planning objectives of this study but does have the potential to deliver local benefits for public transport users in Kirkintilloch. It is therefore recommended that the findings from the review of the Bus Hub are taken on board as part of the future and ongoing masterplanning works for the regeneration of the town centre.
- Both bus-based Park & Ride options (Option 4 and Option 5) would positively address the transport planning objectives of this study. Option 5 in particular has the potential to deliver benefits not only for public transport users travelling into Glasgow, but also for commuters travelling into East Dunbartonshire owing to its vicinity to Westerhill Business Park. If these options are taken forward, it would be recommended that more detailed site specific investigation is undertaken into potential locations for Park & Ride facilities at both locations. For both options, and in particular the Westerhill Option which could require the development of a new service or diversion of existing services, it is to be noted that there would be a need for a minimum level of patronage in order for Park & Ride operations to be sustainable and this would require further examination. These options should also be kept under review pending potential developments in the form of potential new Park & Ride facilities on the M80 Hornshill junction and the Robroyston Park & Ride station, both of which have the potential to impact on the feasibility of the East Dunbartonshire proposals.

- The Kirkintilloch/Lenzie loop bus (Option 6) performs positively against the transport planning objectives, specifically as it
  promotes integration and would improve accessibility between a number of key locations within the study area, and should
  encourage interchange opportunities with Lenzie rail station, which could relieve parking pressures at the station. However,
  there are serious question marks over the commercial viability of this service and it is therefore recommended that this
  option is not advanced at this stage. As an alternative, community and demand responsive transport can play an important
  role in improving local accessibility and in the absence of a commercially viable service may be more appropriate to
  promote for local passengers.
- Given the public concerns and potential environmental impacts around increasing car parking provision at Lenzie rail station (Option 7), it would be recommended that this Option is not considered further and instead opportunities are examined to improve and promote local access to the station by sustainable transport means (i.e. walking and cycling) as an alternative approach to relieving parking pressure at the station.
- Both rail-based Park & Ride options (Option 8 and Option 9) perform strongly against the transport planning objectives of this study and the rail operational review undertaken as part of this study has suggested that both are theoretically feasible. However, significant concerns have been raised about the deliverability and acceptability of additional stops on the Edinburgh–Glasgow rail network in terms of the impact of reduced resilience on the line which would likely face opposition in the context of the wider EGIP scheme. Also, while both options would improve accessibility to the Woodilee and Westerhill sites, the transport modelling exercise undertaken has suggested that benefits of the new stations would be abstracted with a new Robroyston Station in place; a proposal which has been advanced considerably further in rail planning terms. If there is still an aspiration to take forward these Options, it would be recommended that more detailed operational modelling is undertaken to investigate the impacts of the schemes on the wider resilience of the rail network. It would also be recommended that should either (or, indeed both) of the new stations be taken forward, the proposed locations should be reviewed against the infrastructure requirements of EGIP Phase 2.
- Finally, a number of wider schemes outlined within the Council's Local Transport Strategy and proposed by partner organisations have the potential to contribute to the delivery of the study's objectives and improve local travel choice and conditions throughout the study area. While the Options appraised at STAG 2 stage have focused on infrastructure based measures, for example, to be a success and deliver the transport planning objectives of this study, including modal shift, these need to be complemented by local access improvements such as walking and cycling facilities, and wider publicity and awareness campaigns. Wider schemes being considered at the regional level around integrated ticketing and passenger information should also continue to be supported given the contribution these can make in delivering a step change in public transport use.

# Appendix A: Mapping of TPOs vs Problems and Opportunities

		Transpol	rt Planning Object	ives (TPOs)	
<u>Mapping of Transport Planning Objectives (TPOs) vs. Problems and Opportunities</u>	<ol> <li>Promote modal shift to sustainable transport modes for trips to key attractors outside of the study area, particularly commuting journeys.</li> </ol>	<ol> <li>Improve public transport journey times and journey time reliability through the study area.</li> </ol>	<ol> <li>Improve accessibility by sustainable transport modes to key trip attractors within the study area</li> </ol>	<ol> <li>Deliver a transport network that supports improvements to human health and air quality, while minimising the impact on the environment.</li> </ol>	<ol> <li>Frovide a sustainable transport network that supports local development, regeneration and contributes to the sustainable economic growth of the study area.</li> </ol>
Problems			Γ	Γ	
<ul> <li>Peak congestion, particularly on A803 through Bishopbriggs with associated impact on journey time reliability and air quality.</li> <li><u>Available evidence</u>:</li> <li>Journey Time surveys undertaken in March 2014 indicated the principal problem occurs in the AM peak Glasgow-bound. For example, between Strathkelvin Retail Park and Stobhill Road, the average journey time by car was found to be 9.5mins, with minimum times in the region of 6 minutes and maximum time up to 24 minutes (during AM peak). Between Stobhill Road and Strathkelvin Retail Park, the average journey time was recorded as 9.4 minutes, with the minimum journey time 6 minutes and the maximum time up to 14 minutes (during PM peak).</li> <li>AADT data suggests that traffic levels have been reducing in recent years after years of sustained growth although issues of congestion at pinch points on the A803 was a frequent issue raised during stakeholder consultation.</li> <li>Bishopbriggs is a designated Air Quality Management Area.</li> </ul>	¥	v	$\checkmark$	$\checkmark$	V
<ul> <li>High levels of through-traffic with a potential negative effect on local traffic movement. Evidence of rat-running.</li> <li><u>Available evidence</u>:</li> <li>Traffic count surveys undertaken as part of a previous Transport Assessment provided by the Council indicates that rat-running occurs during the peaks as commuters avoid congestion and delays on the A803 Kirkintilloch Road. For example, in the morning peak, 34% (356 pcu's) of southbound traffic on the A803 north of Westerhill Road junction turn left into Westerhill Road, with it being assumed that many of these vehicles route south east to join the M80. Similarly, during the morning peak period, survey data also suggested a large number of vehicles also route south east via Cowden Road and Wester Cleddens Road to the M80.</li> <li>Issue highlighted during consultation, with it being noted that many vehicles make cross-cutting movements across the A803 (due to number of primary and secondary schools in the area) which exacerbated congestion on the A803 around the Bishopbriggs Academy during the AM peak.</li> </ul>	~	V	√	$\checkmark$	
<ul> <li>Parking pressures around rail stations (e.g. Lenzie), and on-street parking in Bishopbriggs including on A803.</li> <li><u>Available evidence</u>:</li> <li>2013 SPT Park and Ride Survey showed commuter based (80%), 30% park on street with the main reason given for this that the Lenzie car park is too busy.</li> <li>ORR data suggests annual number of rail passengers at Lenzie has remained constant at around 800,000 passengers since 2004. Consultation has suggested that parking capacity in and around Lenzie is insufficient and may be limiting patronage, with anecdotal evidence that residents in EDC may drive to rail stations in neighbouring authority areas with greater car parking opportunities (e.g. Croy).</li> <li>Woodilee Transport Assessment highlighted that Lenzie Station is "well used, with the car park being always full and parking demand overspilling onto the surrounding residential streets".</li> </ul>	$\checkmark$		$\checkmark$		$\checkmark$

		Transpor	rt Planning Ob
<u>Mapping of Transport Planning Objectives (TPOs) vs. Problems and Opportunities</u>	<ol> <li>Promote modal shift to sustainable transport modes for trips to key attractors outside of the study area, particularly commuting journeys.</li> </ol>	<ol> <li>Improve public transport journey times and journey time reliability through the study area.</li> </ol>	<ol> <li>Improve accessibility by sustainable transport modes to key trip attractors within the study area</li> </ol>
Site visits indicated parking on A803 Kirkintilloch Road and on local residential streets near the Bishopbriggs station.			
<ul> <li>Bus journey time reliability on the A803 during peak times, and also on the M8 approach to Glasgow (express services from East Dunbartonshire via the A806).</li> <li><u>Available evidence:</u> <ul> <li>Consultation with bus operator suggested that their main problems are associated with congestion (mainly along the A803, between Hilton Road and Bishopbriggs Cross) which affect bus journey time reliability. The situation is particularly noticeable in the southbound direction.</li> <li>Bus journey time surveys undertaken in March 2014 revealed that between Stathkelvin Retail Park and Stobhill Road, the average bus journey time was 13.8 minutes, with a minimum journey time of 9 minutes and maximum journey time of 28 minutes (recorded during the AM peak). Between Stobhill Road and Stathkelvin Retail Park, the average bus journey times was 12.3 minutes with a minimum journey time of 10 minutes recorded and a maximum journey time 18 minutes recorded (during the PM peak).</li> </ul> </li> <li>Despite the affluence of the area there still remain areas of deprivation, according to the Scottish Index of Multiple Deprivation (SIMD).</li> <li><u>Available evidence:</u></li> <li>Hillhead remains the most deprived area in East Dunbartonshire with 3 datazones in the area have declined in rank. The Hillhead intermediate zone has 2 datazones in the top 5% most deprived in Scotland and five of the 8 most deprived datazones in East Dunbartonshire include Lennoxtown and Milngavie town centres as well as Auchinairn which all contain datazones in the top 25% most deprived in Scotland.</li> </ul>	✓	✓	×
Opportunities			
<ul> <li>Opportunity to promote active travel for shorter trips.</li> <li><u>Available evidence</u>:</li> <li>Around a third of home to work/study journeys are undertaken within the Council boundary according to Census 2011 information.</li> </ul>			$\checkmark$
The Council has identified locations in the Local Plan 2 where it has reserved land for investigation of potential new rail halts at Woodilee and Westerhill, including Park-&-Ride provision.	$\checkmark$	$\checkmark$	
Rail patronage between East Dunbartonshire and Glasgow has been increasing. Focused resources on improved rail services to Glasgow may support modal shift. <u>Available evidence</u> :	$\checkmark$	$\checkmark$

There are various environmental constraints in the area including an AQMA, Conservation Areas, Heritage Sites (Antonine Wall) and important wildlife corridors.				~	
Transport Scotland's EGIP programme has a target journey time on the Edinburgh-Glasgow rail line, which limits the prospects for additional stops for existing services (unless existing stops are dropped).	$\checkmark$				$\checkmark$
The presence of Park and Ride facilities at rail stations within the vicinity of the study area could be viewed as both an opportunity and a constraint. For example, there is anecdotal evidence that residents in the study area will drive to Croy to access rail service, and even Milngavie. Future proposals for Park and Ride, and potentially a new rail halt, at Robroyston would also abstract rail and bus patronage from the study area.	$\checkmark$		$\checkmark$		

# **Technical Note**

Project:	EDC A803/A806 Route Corridor Study (Kirkintilloch/Lenzie-Bishopbriggs-Glasgow Route Corridor Study)	Job No:	60331121
Subject:	Option Appraisal Assumptions		
Prepared by:	Peter Fullerton	Date:	04 December 2014
Checked by:	Richard Hernan	Date:	04 December 2014
Approved by:	Richie Fraser	Date:	23 February 2015

ΔΞϹΟ/

#### 1. Introduction

This technical note presents further detail on the definition of the options assessed as part of the STAG Part 2 process, including the assumptions that have been made.

## 2. Options Development & Appraisal Assumptions

#### Option 1 – Do Minimum $\geq$

This option considers the impacts on the local transport network if no improvements are made other than the following committed schemes:

- Bishopbriggs Relief Road (up to and including Phase 5 which will link the roundabout north of the railway on Westerhill Road, to the A803 at Torrance Roundabout);
- SCOOT to be implemented on New Lairdlands Road between the A803 and Catherine Street . (inclusive) within Kirkintilloch;
- Kirkintilloch Town Centre Regeneration<sup>1</sup>;
- Parking Strategy and Decriminalised Parking Enforcement;
- EGIP Phase 1<sup>2</sup>; and •
- Glasgow City Council City Centre Transport Strategy.

In addition, a proposed rail station with Park and Ride at Robroyston will be considered as a Reference Case. It is understood that the capacity of the Park and Ride site is initially likely to be 200 spaces with a second phase bringing capacity up to 400 spaces as it grows over a 15 - 20 year period<sup>3</sup>. The Robroyston / Millerston Community Growth Area STAG Appraisal (August 2012) suggested a 30 minute frequency for trains.

<sup>&</sup>lt;sup>1</sup> The Kirkintilloch Town Centre regeneration will involve: removal of clutter in streets; where possible, pavements will be widened and public space will be created; physically narrowing carriageways, whilst also allowing for two-way traffic flow; reducing kerb heights, but ensuring a drop remains between kerb and carriageway; placing raised table junctions at key locations in the town centre (West High Street, Regent Gardens, Catherine Street and Barleybank); providing more crossing points to reflect preferred pedestrian movements; ensuring all crossing points can be easily negotiated by the visually impaired and are Equality Act 2010 compliant; improving bus stops where required; and take into account the need for a greater provision of cycle parking outside key locations and accommodating the needs of cyclists.

EGIP Phase 1 includes the redevelopment of Haymarket Station; electrification of the Cumbernauld line and the introduction of electric trains; electrification of the core Edinburgh to Glasgow via Falkirk High Line and the opening of Edinburgh Gateway station with connections to Fife line services; 42 minute fastest journey time between Edinburgh and Glasgow and the introduction of 8 car electric trains; and redevelopment of Queen Street Station

http://www.spt.co.uk/documents/RTP090514\_agenda14.pdf

## > Option 2 – A803 QBC

#### Option Description

A Quality Bus Corridor in partnership with operators and EDC/SPT on the A803 between Torrance Roundabout and Colston Road, to provide measures to improve bus journey times and journey time reliability for all bus movements on this corridor.

Traffic engineering measures could include a combination of:

- Congestion by-pass lanes at up to 11 signalised junctions (lanes up to 100m in length with additional signal heads to provide priority);
- Continuous bus lanes
  - A. Southbound between Access to Morrisons and Colston Road (may require center line to be moved into northbound carriageway over sections and some parking restrictions both northbound and southbound. Parking restrictions in proximity to Bishopbriggs Station likely to meet resistance due to lack of dedicated railway car parking facilities.)
    - or
  - B. Potentially northbound and southbound between access to Morrisons and Colston Road over some sections (would require parking restrictions both northbound and southbound. Parking restrictions in proximity to Bishopbriggs Station likely to meet resistance due to lack of dedicated railway car parking facilities.)

or

C. Potentially southbound continuous lane from a point on the A803 to the north of the B819 roundabout to Colston Road.

or

- D. Potentially Southbound continuous lane from a point on the A803 to the north of the B819 roundabout to Colston Road with carriageway widening in sections.
- Parking restrictions at peak periods (potentially various combinations of the below);
  - A. Southbound between Access to Morrisons and Colston Road (Parking restrictions in proximity to Bishopbriggs Station likely to meet resistance.)
  - B. Northbound between Access to Morrisons and Colston Road (Parking restrictions in proximity to Bishopbriggs Station likely to meet resistance.)
  - C. Northbound between Viewfield Road and Colston Road (inc. opp. Arnold Clark);
  - D. Southbound between Viewfield Road and Colston Road (inc. opp. Arnold Clark)
- Infill bus stop lay-bys (7 potential locations);
- Closing up minor junctions to minimise delay (Cowden Drive & Park Road western junction);
- Enhancing passenger waiting facilities (upgrading 3 stops from poles to shelters);
- High access kerbing (at 3 locations);
- Real time information displays at 17 shelters on A803;
- Alteration to traffic turning movements and lane priority (possibly at Cowden Drive); and
- Priority for buses via SCOOT at 9 signalised junctions.

#### Public Transport Service Provision

The QBC assumes the route would be used by existing services which would benefit from improved journey times and journey time reliability through this section of route until the Glasgow City Council boundary where services would be subject to the GCC Statutory Quality Partnership (SQP).

Existing services operating through Bishopbriggs town centre and rail station include:

Bus Service	Frequency	
147 (to Scotstoun)	Every 30 min (AM)	
27, 24 (Kirkintilloch / Bishopbriggs – Glasgow)	Hourly	
88A, 88C (Kirkintilloch/ Bishopbriggs – Glasgow)	Every 15min (30min on Sunday)	
142 (Bishopbriggs - Auchinairn/Westerhill)	Every 40mins	
147 (Scotstoun – Bishopbriggs)	Limited Service	
57, 57A (Westerhill/Auchinairn – Glasgow)	Every 15min (20min on Sunday)	

Journey time surveys undertaken for a portion of this route (between the stop in proximity to Strathkelvin Retail Park and the stop in proximity to Stobhill Road – both on the A803) suggest an average journey time during the peak period for a southbound trip of 13 minutes and 48 seconds, a minimum time of 9 minutes and a maximum time of 28 minutes.

For the purposes of modelling we have assumed (after the successful implementation of the QBC engineering measures and the Do Minimum scenarios) a journey time reduction of 2 minutes from the average journey time suggested by the journey time surveys.

#### Key Assumptions

- Bus service frequencies / routes remain at current levels;
- Bus lanes would operate during peak hours only;
- Core bus services will not migrate onto the BRR;
- Peak bus services will be double deck (79 seats);
- Bus shelters are free to remove/replace/relocate and not subject to contract; and
- Focused on improving journey times and reliability southbound, towards Glasgow.

#### > Option 3 – Kirkintilloch Bus Hub

#### **Option Description**

This option consists of delivering a bus hub in Kirkintilloch and associated measures to provide a greater focus point for buses with shared facilities such as information better waiting areas and linked to other local amenities. It would involve potential landtake to bring bus stops closer together into an interchange area in the town centre, together with lower cost measures including, pedestrian and cycling access improvements, more public transport information in the form of 2 information kiosks, and 2 high specification bespoke shelters.

The location of this option would be subject to further feasibility and design work. For the purposes of the appraisal, it is proposed that the bus hub would be located in the town centre adjacent to the main

Page: 3 of 8 Doc. F8/10 Revised: April 2009

F:\PROJECTS\Transport Planning - A803 Corridor Study STAG Part 2\03 EXECUTION\07 Technical Work\Draft Report V2\_Jan 15\APPENDICES\Appendix B - Option Appraisal Assumptions\APPENDIX B Option Appraisal Assumptions.docx

pedestrian thoroughfare, incorporating pedestrian and cycling access improvements and thereby enhancing integration between walking, cycling and bus modes.

It is anticipated that the optimum location for a bus hub is at the north-western end of the town centre on Cowgate, between Catherine Street and West High Street. This is the location of the main retail thoroughfare, and within the proximity of William Patrick Library an important civic hub. The width of footways and carriageway is at their optimum within this area, providing greater flexibility in design whilst not compromising pedestrian movement and access to retail premises. There would be one facility on each side of the road.

#### Public Transport Service Provision

Existing bus services operating through Kirkintilloch town centre include:

Bus Service	Frequency		
178 (Kirkintilloch – Moodiesburn)	Hourly		
X81 (Woodhill - Glasgow)	Every 30 min (Mon – Fri)		
72 (Glasgow - Lenzie/Kirkintilloch)	Hourly		
X85, X86, X87 (to Glasgow)	Every 30 min / Hourly (Mon-Sat)		
47/47A (Milngavie - Monklands Hospital via Kirkintilloch)	Every 30 min		
84 (Twechar – Kirkintilloch)	Hourly		
88A, 88C (Kirkintilloch / Bishopbriggs – Glasgow)	Every 15mins (30mins Sunday)		
72 (Glasgow - Lenzie / Kirkintilloch)	Hourly		
27, 24 (Kirkintilloch / Bishopbriggs – Glasgow)	Hourly		

#### Key Assumptions

- Existing bus services and routes will remain unchanged;
- The core ambitions of the Masterplan are realised; and
- The bus hub will be located on Cowgate, between Catherine Street and West High Street.

#### Option 4 – Bus Park-&-Ride adjacent to / in the vicinity of the B757 or KLR

#### **Option Description**

Bus based Park and Ride adjacent to the B757 or Kirkintilloch Link Road (KLR). The facility would accommodate existing express services which link Kirkintilloch and Lenzie with Glasgow via the M80 and M8.

Whilst a number of possible locations have been considered, the specific site for the facility has not yet been determined – this would be dependent on several factors including land availability, land ownership, environmental considerations and anticipated impacts on the road network.

Notwithstanding this, it is anticipated that the Park and Ride on the B757 would have to be built on an existing gap site or within the greenbelt. Given the limited land in the area it is likely that the facility would need to be located south of Lenzie on the B757.

Page: 4 of 8 Doc. F8/10 Revised: April 2009

#### Public Transport Service Provision

Locating the Park and Ride facility adjacent to the B757 would be a suitable location for integration with the existing high frequency First Glasgow X85 and X87 express bus services. The X85 service during the AM peak (assumed to be between 0630 hours and 0930 hours) in the Glasgow bound direction has a frequency of between 12 and 31 minutes (although the first service doesn't leave Kirkintilloch town centre until 7:09 AM). The X87 service during the AM peak in the Glasgow bound direction has a frequency of between 12 and 33 minutes (although the first service doesn't leave Kirkintilloch town centre until 6:54 AM). These services are offset from each other such that the combined frequency of services from the proposed Park and Ride to Glasgow would be between 4 and 19 minutes.

Locating the Park and Ride facility adjacent to the KLR would be a suitable location for integration with the existing First Glasgow X86 express bus services. This X86 service during the AM peak in the Glasgow bound direction has services at 7:25, 7:55 and 8:55. Locating the Park and Ride adjacent to the KLR would be dependent on increased bus service provision; diverting either the existing X85 or X87 services would ensure that no new services would be required. It is anticipated that this would achieve an approximate 15 minute service during the peak period.

#### Key Assumptions

- Utilises existing bus services; no new services required;
- Peak bus services will be double deck (79 seats);
- No bus priority on M80;
- 300 space Park and Ride<sup>4</sup>, similar in design to Hampden Park and Ride;
- Located south of Lenzie on B757 or the KLR;
- Facility will have welfare facilities, covered cycle parking, high quality passenger information, shelters and raised access kerbs;
- Journey time increases for existing bus services as a result of diverting to the proposed Park and Ride site (1 additional stop) will be minimal; and
- The existing road network can accommodate the additional traffic generated by vehicles travelling to Park and Ride site.

#### Option 5 – Bus Park & Ride adjacent to the BRR

#### Option Description

Bus-based Park and Ride adjacent to BRR east of Westerhill industrial area.

The Park and Ride facility would be located in the vicinity of the BRR. The specific site for the facility has not yet been determined – this would be dependent on several factors including land availability, land ownership, environmental considerations and anticipated impacts on the road network. One potential site is located east of the Westerhill industrial area and north of the railway line.

The Park and Ride proposal assumes a dedicated new bus service from the Park and Ride site to Glasgow, every 15 minutes during the AM peak (assumed 0630 hours to 0930 hours), and every 15 minutes from Glasgow in the PM peak (assumed 1600 hours to 1900 hours). It has been assumed that four new vehicles would be required to provide this level of service although amending the route of the

<sup>&</sup>lt;sup>4</sup> It has been assumed that the Park and Ride site would accommodate 300 vehicles. This assumption is based on the fact that a regional Park and Ride site would typically accommodate 500 to 1,000 spaces, and smaller sites could generally accommodate approximately 200 spaces. Detailed work would be required to accurately determine the capacity that is required and achievable in engineering terms.

Page: 5 of 8 Doc. F8/10 Revised: April 2009

F\PROJECTS\Transport Planning - A803 Corridor Study STAG Part 2\03 EXECUTION\07 Technical Work\Draft Report V2\_Jan 15\APPENDICES\Appendix B - Option Appraisal Assumptions.\APPENDIX B Option Appraisal Assumptions.docx

existing express X81 service may reduce the number of buses required. It is, however, noted that initial discussions with First Bus Glasgow indicated that extending existing services would not be attractive in operational terms. During the off-peak period (0930 hours to 1600 hours, and 1900 hours to 2200 hours), the dedicated bus service is assumed to operate at a frequency of 30 minutes.

The facility could be designed similarly to the Hampden Park and Ride in Glasgow - such a layout is preferable to the main bus operator in the area.

It is likely that parking controls would be required to avoid the car park being used as an overspill car park for workers at the Westerhill Business Park. Without restrictions it may increase car travel rather than reduce and limit spaces for commuters to Glasgow.

It is acknowledged that full implementation of the BRR may increase the viability of this option and maximise modal shift opportunities.

#### Key Assumptions

- Implementation of dedicated new bus service, every 15 minutes during peak periods and every 30 minutes during off-peak period. It has been assumed that four new vehicles would be required to provide this level of service although amending the route of the existing express X81 service may reduce the number of buses required;
- Peak bus services will be double deck (79 seats);
- No bus priority on M80 or on the BRR;
- 300 space Park and Ride<sup>5</sup>, similar in design to Hampden Park and Ride;
- Located east of Westerhill industrial area;
- Some form of enforcement / management regime would be in place to prevent parking associated with the nearby businesses;
- Facility will have welfare facilities, covered cycle parking, high quality passenger information, shelters and raised access kerbs; and
- The existing road network can accommodate the additional traffic generated by vehicles travelling to the Park and Ride site.

#### Option 6 – New Bus Loop Service in Lenzie & Kirkintilloch

#### Option Description

A potential new loop bus service linking key locations such as Lenzie Railway Station, Kirkintilloch Town Centre, Woodilee, residential areas and the Council's main offices. The service would be timetabled to dovetail with rail services at Lenzie Rail Station, thus significantly improving integration between bus and rail modes.

It is understood that as part of the Transport Assessment for the Woodilee development a circular bus route was proposed but not progressed; the proposed route for the service included Garngaber Avenue, Lenzie Rail Station, Kirkintilloch Road, Waterside Road, Market Road and through the Woodilee development.

The new service would include a 15-minute frequency in each direction during the peak and a 30-minute frequency in each direction during the off-peak period. In order to provide this level of service during the peak period four buses would be required and during the off-peak two buses would be required.

Key Assumptions

<sup>&</sup>lt;sup>5</sup> As per footnote 2.

Page: 6 of 8 Doc. F8/10 Revised: April 2009

F\PROJECTS\Transport Planning - A803 Corridor Study STAG Part 2\03 EXECUTION\07 Technical Work\Draft Report V2\_Jan 15\APPENDICES\Appendix B - Option Appraisal Assumptions\APPENDIX B Option Appraisal Assumptions.docx

- Peak bus services will be single deck (23 seats);
- No specific bus priority;
- Existing rail service remains at current operating levels;
- A 15-minute frequency in each direction during the peak period and a 30-minute frequency in each direction during the off-peak period;
- The 15-minute frequency in each direction during the peak periods would require 4 buses and the 30-minute frequency in each direction during the peak periods would require 2 buses; and
- Not commercially operated.

## > Option 7 – Increase Parking Provision at Lenzie Rail Station

#### Option Description

Lenzie rail station has two car parks available for customers. One is located to the north of the station and is accessed from the B757 Kirkintilloch Road, accommodating approximately 100 car parking spaces. This car park in located parallel to the track and passengers can access Platform 1 directly from the car park. The local bus service and taxi rank are also located to the north side of the station.

The second car park is located to the southwest of the station and is accessed by exiting the B757 Auchinloch Road at Beechmount Road, then turning into Victoria Road then onto Alexandra Avenue. This car park can accommodate up to 50 vehicles and has two spaces for disabled parking. Anecdotal evidence from the consultation workshop, and on-site observations have suggested both car parks are full on a regular basis, which leads to customers parking in the neighbouring streets (Victoria Road and Alexandra Avenue). Passengers can access platform 2 directly from the car park. There is a footbridge connecting the two platforms further east, but is only accessible by stairs.

Two sub-options have been considered to increase parking provision at Lenzie rail station:

*a)* Surface access: extension of the existing northern car park at Lenzie station at ground level, to the west along the route of an existing Core Path. This would create approximately 100 additional spaces.

b) Deck over Lenzie Rail station: surface access car parking deck over one, or both, of the existing car parks and possibly over the track, providing up to 200 additional parking spaces.

#### Key Assumptions

- For option a) land outwith the current station boundaries will be required. For option b) there will be no additional land required;
- Option a) will provide approximately 100 additional spaces and option b) would provide approximately 200 additional spaces; and,
- Rail service frequencies remain unchanged.

#### Option 8 – Develop a New Rail Station at Woodilee (with Park & Ride)

#### **Option Description**

This option incorporates a new rail station at Woodilee, and an associated Park and Ride facility.

The new station would be located between the A806 Initiative Road and Calfmuir Road within the existing railway cutting. As there are no existing sidings at this location, there would be a requirement to undertake heavy civil engineering works to widen the cutting to accommodate two new platforms and to lay two additional parallel tracks to reduce timetabling conflicts between stopping trains and through services.

# **Technical Note**

Depending on the size of rail station required, a station building and car park may be best located on land to the south of the track, since there is more land adjacent to the tracks available there, without the constraints of the recent residential developments that have taken place on the north side.

As space within the Woodilee development is limited, parking may be restricted to 40-50 vehicles. There is a field on the south side of the railway line which could house a significant parking facility (c. 300+ spaces) but may require significant engineering to realise. As such, the appraisal has focused on the smaller Park and Ride site.

Trains on the Stirling to Glasgow line would stop at the new station providing a 30-minute frequency.

#### Key Assumptions

- Approximately a 40 to 50 space car park;
- Half-hourly service in both directions, working within existing timetables;
- Station facilities to include shelters, benches, communication equipment and timetable information; and
- Two platforms, Equality Act compliant, which will require step-free access, therefore a lift or ramp and overbridge would be required.

#### > Option 9 – Develop a New Rail Station at Westerhill (with Park & Ride)

#### **Option Description**

A new rail station to improve sustainable access to the Westerhill area, with associated Park and Ride facility.

There are two possible locations for the railway station. The first option is to the west of the Westerhill Road bridge (EGM1/109) adjacent to the main up/down railway lines. The second option is to the east of the Westerhill Road bridge (EGM1/109) where, in addition to the main up/down railway lines, a number of sidings are located. It is not known how often these sidings are used, if at all. This could be an ideal location to place a new rail station, as there would be no need to install new tracks if the existing sidings could be utilised as up and down passing loops. This would minimise the amount of track construction and signalling required. There is large amount of space surrounding the sidings that would allow for a station to be constructed along with adequate car parking facilities on both sides of the track. It should be noted that the land on the south side is in North Lanarkshire and not East Dunbartonshire.

The Park and Ride element of this facility may need to be subject to restriction as it could be used as an effective overspill car park for workers at the Westerhill Business Park.

#### Key Assumptions

- 300 space car park<sup>6</sup>;
- Half-hourly service in both directions, working within existing timetables;
- Station facilities shelters, benches, communication equipment and timetable information;
- Two platforms, Equality Act compliant, which will require step-free access, therefore a lift or ramp and overbridge would be required; and
- No additional rail infrastructure, i.e. lines or bypasses.

Page: 8 of 8 Doc. F8/10 Revised: April 2009

<sup>&</sup>lt;sup>6</sup> It has been assumed that the Park and Ride site would accommodate 300 vehicles. This assumption is based on the fact that a regional Park and Ride site would typically accommodate 500 to 1,000 spaces, and smaller sites could generally accommodate approximately 200 spaces. Detailed work would be required to accurately determine the capacity that is required and achievable in engineering terms.

# Table of Contents

Executive Summary	1
Introduction	2
Parking Provision at Lenzie Station	3
Rail Halt 1 – Westerhill Business Park	5
Rail Halt 2 – Woodilee Development Site	7
Summary	9

# **Executive Summary**

AECOM have been appointed by East Dunbartonshire Council (EDC) to examine the options available for upgrading the existing parking facilities at Lenzie Station, and to undertake a feasibility study of two new rail halts on the Glasgow to Edinburgh via Falkirk railway line.

Lenzie station has two car parks but both tend to become full during peak periods. Having reviewed options for further parking provision, there seems to be scope to provide this in a number of ways. But, since the station is between two conservation areas, planning concerns would be a key constraint.

Following site inspections and a desktop review of relevant documentation. AECOM believes it could be feasible to construct two new rail halts at Westerhill Business Park and Woodilee Development. However, whilst Westerhill Business Park has adequate space and existing sidings which could be utilised to create a new rail halt. The Woodilee site would require new tracks to be laid adjacent to the existing tracks. This would require substantial amounts of heavy civil engineering works.

# Introduction

East Dunbartonshire Council (EDC) shares a boundary with the following neighbouring councils: Glasgow City, North Lanarkshire, Stirling and West Dunbartonshire. Due to the close proximity to Glasgow, many of the towns within East Dunbartonshire are within commuting distance of the city.

There are currently six rail stations located within East Dunbartonshire. Over a five year period the number of rail passengers using these stations has increased by 31%. Lenzie Station (LNZ) is one of the six existing stations within the council, which is situated on one of the busiest rail routes across central Scotland, the Glasgow to Edinburgh (via Falkirk) line. EDC is keen to encourage more use of public transport, and with several major developments currently under construction, or planned, within the local area, it is envisaged that the stations' passenger traffic will increase further.

AECOM has been appointed by EDC to undertake a feasibility study to consider additional parking provisions at the existing Lenzie station, and to study the feasibility of two additional rail halts on the same railway line, to help accommodate growth in these areas.

# Parking Provision at Lenzie Station

Lenzie Station is located 6.5 kilometres east of Bishopbriggs Station. The station is equipped with closed-circuit television systems, digital information boards, waiting shelter (on both platforms), bike storage and electronic ticket system. The platforms appear to have been recently resurfaced as part of a Network Rail renewal programme and can accommodate six car trains. As with Bishopbriggs, there is no OLE at this station at present, but this is due to be installed as part of the EGIP works. Network Rail have no current plans to extend the platforms. Garngaber Avenue and South Lenzie Conservation Areas sit directly to the north and south of the station respectively.

This station has two car parks available for customers. Car Park A lies to the north of the station and is accessed from the B757 Kirkintilloch Road. This car park runs parallel to the track and passengers can access platform 1 directly from the car park. The local bus service and taxi rank are also located to the north side of the station. There is a cycle path approximate one kilometre to the east of the station.

Car Park B lies to the southwest of the station and is accessed by exiting the B757 Auchinloch Road at Beechmount Road, then turning into Victoria Road then onto Alexandra Avenue. This car park can accommodate up to 50 vehicles and has two spaces for disabled parking. From speaking with staff at the station, both car parks are full on a regular basis, which leads to customers parking in the neighbouring streets (Victoria Road and Alexandra Avenue). Passengers can access platform 2 directly from the car park. There is a footbridge connecting the two platforms further east, but is only accessible by stairs.

To cope with the parking demands at Lenzie station, and to encourage additional residents to use the train, EDC are looking to increase the car parking provision. There are two options that could be developed further. The first option would be to extend car park A at ground level, to the west along the route of an existing Core Path (as shown in 'Option 1' figure below). This would require clearance of mature trees between the track and the residential properties to the north, which are in a Townscape Protection Area. It is estimated that this would create an additional 100 spaces. This may require the purchase of additional land and may be affected by tree preservation orders. This expansion is likely to be opposed locally. In terms of the operation of the existing car park, it would have minimal impact during or after construction.

Option 1: Extend Car Park A at Lenzie station (AECOM GIS Map portal)

A second option would be to construct a car parking deck over one, or both, of the existing car parks, and possibly over the track. This could provide a significant increase in parking capacity, but would also have a corresponding increase in traffic on the surrounding streets. There would be the opportunity to provide DDA access between both platforms by providing lifts and a pedestrian link across the track within the car park structure.

No additional land should be required to be purchased for this solution and the construction would not affect the existing ecology. However, it would be more visible, especially if it was to extend over the track, since the clearance from the track to the soffit would need to be over 5.1m to allow for the future electrification. Therefore, there may be stronger local opposition to this.

It should also be noted that the existing car park would need to be closed off in phases to allow construction, which would impact on surrounding streets.

Option 2: Single storey car park over car park A and B (AECOM GIS Map portal)

# Rail Halt 1 – Westerhill Business Park

Westerhill Business Park is situated approximately two kilometres (20 minutes by car) to the northeast of Bishopbriggs town centre. It has a number of large employers at present and several sites within the business park have been identified for future growth. Westerhill Road connects the business park to the A803 Kirkintilloch Road and to Wester Cleddens Road.

To the south of the business park, lies the Glasgow to Edinburgh (via Falkirk) line, which acts as a boundary between East Dunbartonshire and North Lanarkshire Council land. As stated previously, the line is expected to be electrified as part of the EGIP works.

To ease traffic congestion around Bishopbriggs town centre, EDC is proposing to construct the Bishopbriggs Relief Road (BRR). Phase four of the BRR will include a new single carriageway, two new roundabouts with a three span steel/concrete composite road bridge. The new section of road will be situated approximately 50m to the east of the existing Westerhill Road Bridge (EGM1/109) and will cross the railway line. The new road will bring a larger volume of traffic past the business park and will provide a link between the eastern and northern communities of Bishopbriggs with the M80 to the south and the village of Torrance to the north.

Within this area there are a number of possible options available for construction of a rail halt. To the east of structure EGM1/109, there are a number of sidings that lead off the main up/down lines. The loop lines could be shortened or removed to allow for the construction of platforms alongside the main lines. However, due to the intensive use of the railway within the section and the high costs associated with works it is unlikely that this option would be progressed. An alternative option would be to realign the loops and yard tracks further away from the mainline. This would allow for platforms to be built between the lines meaning that they could serve either the mainline or the loops. Due to the location of the existing signals the platforms would be required to be placed at least 400m away from the overbridge. Again due to the high costs associated with this option it is unlikely that this option would be progressed. Another alternative and more feasible option would be to place a new rail station alongside the outside passing loops. As this would minimise the amount of track construction in contrast with the other options. Nevertheless, due to the position of existing signalling the platforms would be need to be at least 400m from the overbridge. There is a large amount of space surrounding the sidings that would allow for platforms that could accommodate six car trains and a station buildingwith adequate car parking facilities on both sides of the track. It should be noted that the land on the south side is owned by North Lanarkshire Council and not East Dunbartonshire Council. To allow for DDA compliant access to the Rail halt, a footbridge and stair cases could be built, along with lifts or ramps.

To the west of road structure EGM1/109 is the main up/down railway lines. A station could be located 300m and 100m west of the over bridge. As this location would avoid any crossovers and signals. However, as the area is built up the construction of a station and car park within this location could prove to be problematic.

As part of the feasibility study AECOM has identified several key issues that could potentially impact the chosen location. Some of these have been investigated at a high level and will require further investigation in due course.

#### Access to Halt

As part of the BRR Phase 4 works, there will be new access roads provided to the land adjacent to the sidings. These could become the main access routes to a possible halt during and after construction.

## Flood Risk

AECOM has examined the online SEPA Flood Risk Management Maps to examine the potential risk of flooding. The map indicates that there is no risk from river or coastal flooding. However, there is medium / high risk of surface water flooding to the north and south of the rail lines. The railway lines are not thought to be subject to significant flooding problems in this location.

## Land Ownership

At this early stage AECOM has not investigated landownership boundaries. Both the land to the north and south of the proposed station do not appear to have any planning applications submitted within the last five years, according to both the EDC and North Lanarkshire council's e-planning application websites.

## Tree Preservation Orders (TPO)

There are a large number of trees located within this area, however AECOM have not undertaken a TPO review at this stage.

## Environmental Impact

An environmental impact assessment would be required to be undertaken during the optioneering stage.

## Right of Way / Core Path

AECOM has consulted East Dunbartonshire's Core Paths / Right of Way interactive mapping system which has indicated there is right of way situated to the North of the Westerhill Road Bridge (EGM1/109).

## Mining

AECOM have consulted the Coal Authority interactive maps database, which has indicated that the area is classed as a high risk due to mining works. We do not expect that there would be high risk of mineral instability so close to the railway line, but this would require further investigation in due course.

# Rail Halt 2 – Woodilee Development Site

The Woodilee development site is currently one of the largest re-development projects occurring in East Dunbartonshire. The site is owned by a consortium comprising of Cala Homes, Redrow Homes, Miller Homes and Persimmon. The first phase of the development is under construction and is situated to the south of Kirkintilloch and to the east of Lenzie. It is expected that the development will generate a greater demand for rail services within the area.

To the south of the Cala Homes development lies the Glasgow to Edinburgh (via Falkirk) rail line. A new rail halt within this development area is possible, however due to the space available the options are limited. A possible location for a rail halt is between the A806 Initiative Road and Calfmuir Road in the existing railway cutting. As there are no existing sidings at this location, there would be a requirement to undertake heavy civil engineering works to widen the cutting to accommodate two new platforms and to lay two additional parallel tracks. In order to reduce timetabling conflicts between stopping trains and through services.

The minimum elements that would be required to create a rail halt would consist of two platforms accommodating six car lengths each, a station building and car park accommodating approximately 20 vehicles. The station and car park may be best located on land to the south of the track, since there is more available land adjacent to the tracks and is not constrained by the recent residential developments that have taken place on the north side. To allow a step free access from platform to platform, a DDA compliant footbridge could be constructed with staircases and with ramps or lifts.

As part of the feasibility study AECOM has identified several key issues that could potentially impact the chosen location. Some issues have been investigated at a high level and will require further investigation in due course.

#### Access to Halt

From an initial site inspection it is evident that access for construction vehicles would be from Calfmuir Road on both sides of the track. These routes could then be upgraded after the construction phase to become the main access to the halt. Within the Woodilee development there is an existing footpath that could be linked to the station to allow pedestrian access. On Calfmuir Road, the bridge over the track is narrow with no footways, so this may need widening or replacing.

## Flood Risk

AECOM have examined the online SEPA Flood Risk Management Maps to examine the potential site from flooding. The map indicated that there is no risk from river, coastal or surface water flooding within this area.

#### Land Ownership

At this early stage AECOM have not investigated landownership boundaries. However, there would probably be a requirement to purchase land within the Woodilee development site and land within the farm to the south of the track.

#### **Tree Preservation order**

There are several trees located along the edge of Network Rail boundary with the farm south of the station, however AECOM have not undertaken a TPO review at this stage.

c:\users\macintoshj\appdata\local\microsoft\windows\temporary internet files\content.outlook\8hs2qdzj\60314022-fea-t-0001\_rev\_c .docx

### **Environmental Impact**

An environmental impact assessment would be required to be undertaken in due course.

### Core Paths / Right of Way

Having consulted EDC's Core Path / Right of Way interactive map system, it has been identified that there is a Core Path (Strathkelvin Railway Path) situated to west of the development site parallel to Initiative road.

### Mining

AECOM have consulted the Coal Authority interactive maps database, which indicates that there is not a high risk of ground instability in the area of the proposed halt. However, this would require further investigation in due course.

## Summary

### Lenzie Station

Lenzie station has some potential for expansion, to the west of the car park on the north side, or by constructing a parking deck above the car parks on the north and/or south sides. However both options could potentially receive planning objections due to the effect on the adjacent Conservation Areas and Townscape Protection Area.

Having undertaken an initial site inspection and examined all the information provided, it appears to be feasible to create a rail halt at both the Westerhill and at Woodilee, but Woodilee would require more construction work than the Westerhill site. The advantages and disadvantages are listed below:

WESTERHILL	
ADVANTAGES	DISADVANTAGES
<ul> <li>Good links to the wider community via the proposed Bishopbriggs Relief Road.</li> </ul>	Close proximity to existing Bishopbriggs station may make it unsuitable for co-existence of both stations,
<ul> <li>Adequate space to construct a large car parking facility with taxi, bus and cycle facilities.</li> </ul>	in terms of the impact on timetabling of the inter-city through trains.
• Relatively easy access for construction and access for future maintenance.	• If it was to become an alternative to Bishopbriggs Station, its distance from the town centre may be unacceptable.
<ul> <li>Could make use of existing sidings if permitted by Network Rail.</li> </ul>	
Relatively open, flat site.	
Could become fully DDA compliant.	
<ul> <li>Could potentially ease parking problems at Bishopbriggs station.</li> </ul>	

### WOODILEE

ADVANTAGES	DISADVANTAGES		
<ul> <li>Proximity to new developments.</li> <li>Adequate space to construct a small car parking facility with taxi, bus and cycle facilities.</li> <li>Could become fully DDA compliant.</li> <li>Could potentially ease parking problems at Lenzie station.</li> </ul>	<ul> <li>Close proximity to existing Lenzie station may make it unsuitable for co-existence of both stations, in terms of the impact on timetabling of the intercity through trains.</li> <li>If it was to become an alternative to Lenzie Station, its distance from the town centre may make it unappealing.</li> <li>Not easily accessible from the wider trunk road network.</li> </ul>		

c:\users\macintoshj\appdata\local\microsoft\windows\temporary internet files\content.outlook\8hs2qdzj\60314022-fea-t-0001\_rev\_c .docx

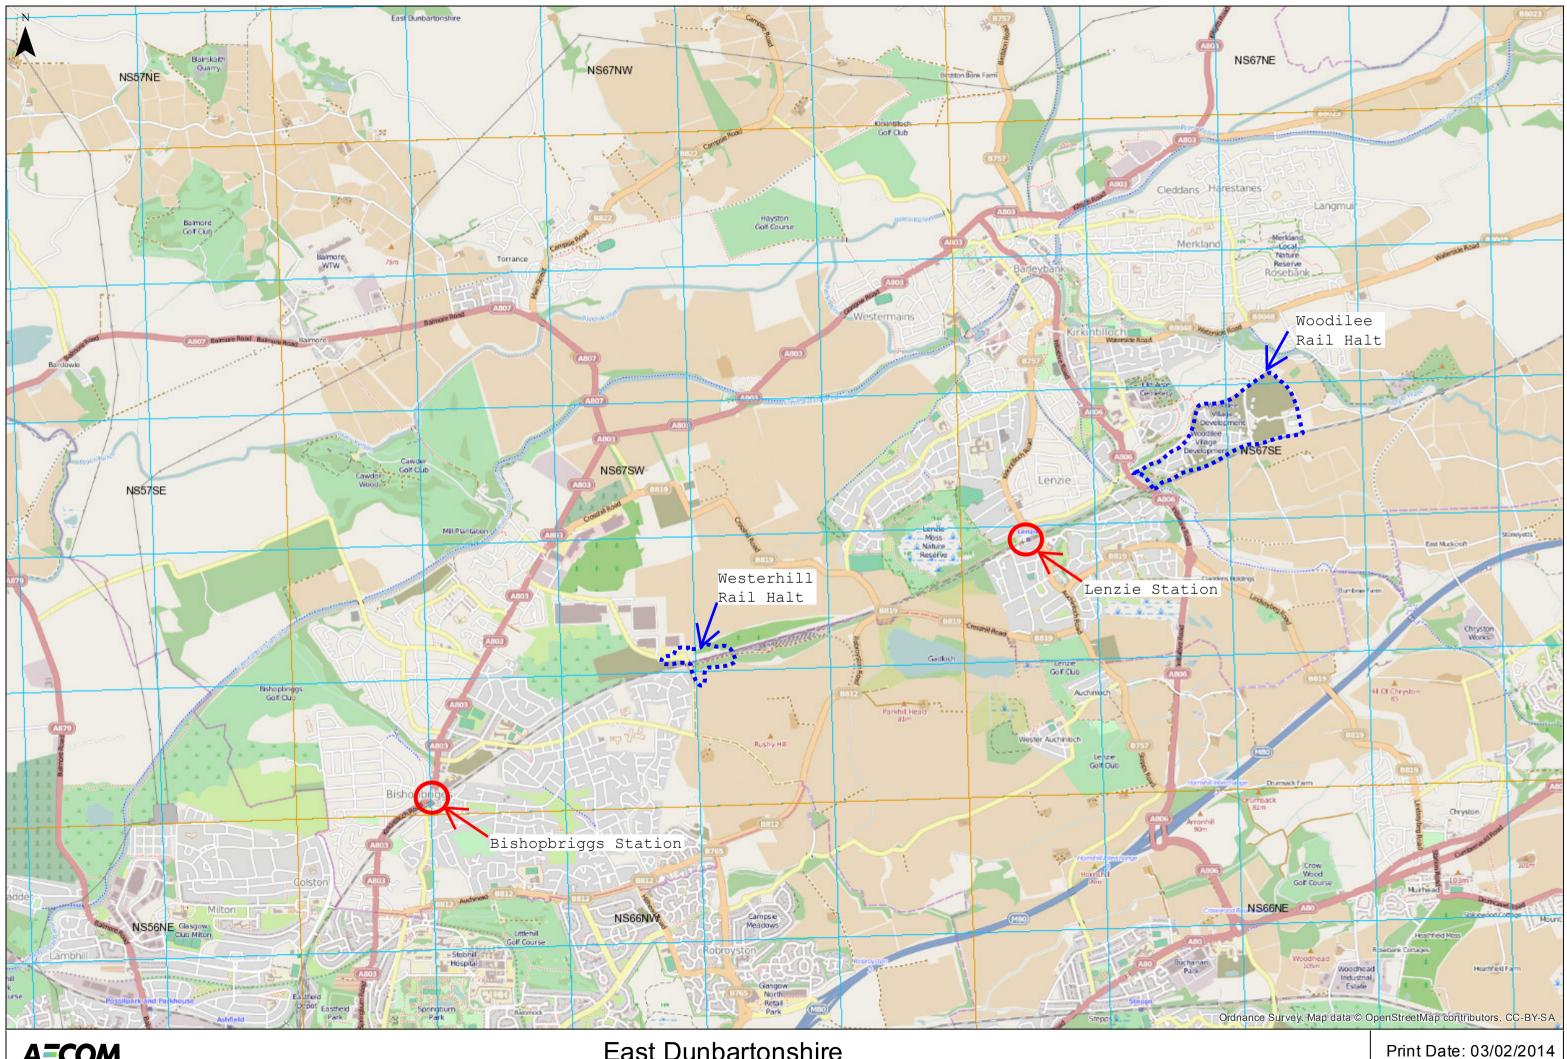

<ul> <li>New track required to be laid parallel to existing track with associated new signalling infrastructure.</li> </ul>
<ul> <li>Substantial civil engineering works would be required (cuttings, retaining walls, access roads).</li> </ul>
<ul> <li>Farm land to the south of the development would be need to be purchased by Network Rail.</li> </ul>
Calfmuir Road and bridge would require upgrading.

### 1.1 Introduction

This note assesses the timetabling issues arising from the proposed addition of stops at Woodilee and Westerhill. It is assumed that these would be served by the stopping trains that run about every 30min in the off-peak timetable between Glasgow Queen Street and Stirling (continuing to Dunblane or Alloa). With the exception of shorter journey times arising from the use of electric trains, it is assumed that the infrastructure and factors governing timetable planning remain as today. It is also necessary to make certain assumptions regarding the service pattern and rolling stock types that will apply in the future, as recorded in the text below, since these details are not available at the time of writing.

### 1.2 Methodology

The route currently carries trains about every 15min between Glasgow and Edinburgh, which join and leave the Stirling route at Greenhill Upper Junction. Alternate trains stop at Croy with the others being non-stop over this section. Thus there are four "gaps" between Glasgow-Edinburgh fast trains in every hour. The Stirling stopping trains occupy two of these with an Aberdeen or Inverness fast train occupying one or two, leaving some capacity available for other services.

All passenger services are currently operated by and timed for diesel multiple unit trains. However committed electrification schemes will see the Glasgow-Edinburgh and Stirling stopping trains replaced by electric multiple units (EMUs) with greater acceleration. Hence our baseline assumes that these workings run at current frequencies but in faster timings consistent with the performance of modern EMUs with a top speed of 100mph. These timings have been estimated by our ARTEM train performance model, which has been shown to give good correlation with working timetables on a wide variety of projects and when set to give the appropriate diesel timings also correlates well with the times of the stopping services between Glasgow and Stirling.

### 1.3 Station Site Issues - Westerhill

Westerhill station is assumed to be located near the Westerhill Road overbridge which is at about chainage 4 miles 45 chains, between Bishopbriggs and Lenzie, This coincides with the western end of Cadder Yard, where there are loops for faster trains to overtake slower ones and also some sidings. Sketches suggest a location east of the overbridge, which requires one of the following:

- Loop lines shortened or removed to make space for platforms alongside main lines probably unacceptable given the intensive use of this section of railway.
- Loop lines to be relocated to another site costly.
- Platforms to be outside the loop lines all trains serving the station would have to use the loops, limiting the use of the loops for other purposes, unless it is proposed that the loops become part of a future slow line under EGIP phase 2 as discussed below. Because of the positions of the signals, the west ends of the platforms would have to be at least 400m east of the overbridge.

Operational Review of Rail Halt Si	ites\Append	dix D - Technic	al Note stations operational issues.docx	

• Loops and yard tracks realigned further from the main lines with platforms in between, either serving the main lines only or each having two faces to loops as well. This would appear to be feasible but costs would be significant. Because of the above signal constraint and to make room for the realigned loop tracks, the west ends of the platforms also have to be at least 400m east of the overbridge.

Alternatively a site between 100m and 300m west of the overbridge would avoid the need for measures, and also avoids the crossover and signals located in this area. However this area is more built up and finding space for a station and car park would be more problematic.

Curvature and gradient do not constrain the location of a station anywhere in this vicinity.

### 1.4 Station Site Issues - Woodilee

Woodilee station is assumed to be located at the Calfmuir Road overbridge which is at about chainage 7 miles 30 chains, between Lenzie and Croy. This is on a gentle curve of about 2500m radius and a gentle gradient of 1 in 900 and is not in proximity to any signals. No significant operational issues are envisaged with locating a station at this site, though design work for any future re-signalling needs to take account of the possibility of a station when positioning new signals.

### 1.5 Results for Off-Peak Baseline Timetable

With current stopping patterns ARTEM indicates that the electric stopping train requires 8.5 minutes from leaving Croy to arriving Bishopbriggs or vice versa, inclusive of an intermediate stop at Lenzie. This increases to 11.5min with the two extra stops, each with a dwell time of 30s as used at other stops on the route, or to 12min if a 60s stop is made at Lenzie as happens with the current service. Even with these stops included it is possible for the stopping train to fit into the "window" between Edinburgh trains, provided that, as now, it precedes the service that stops at Croy out of Glasgow and follows it into Glasgow. All intervals between trains are compliant with Network Rail's Timetable Planning Rules and the timetable has been checked to be conflict-free with Glasgow passenger trains as far as Dunblane (trains between these stations and Edinburgh are assumed to be adjusted to fit the electric timetable and thus not to constrain the Glasgow trains).

Therefore it may be concluded that these two stops are operationally feasible under a timetable giving Glasgow-Edinburgh services about every 15min, assuming the stopping services are operated by modern 100mph electric units. The timetable below shows 30s dwell times at all intermediate stops, as is typical for electric suburban services, but it is still workable if some stops are increased to 60s.

### 1.6 Results for Peak Services

The peak extra services in today's timetable have also been assessed, including associated empty workings, based on today's timetable with electric units substituted on those services that do not run beyond the future electrified network. To achieve this, the trains concerned have been re-timed in some cases, and some timing margins have been reduced where they are above the minimum stipulated in the Network Rail timetable planning rules. Arrival and departure times at Glasgow Queen Street have remained the same as per the current timetable.

- The Dundee to Glasgow Queen St service arriving 07.34 cannot stop at Woodilee or Westerhill.
- The Lenzie to Glasgow Queen St service arriving 07.47 can come into service at Croy and serve one of the new stations, or could serve both if a train from Edinburgh ran 1½min later
- The Alloa to Glasgow Queen St service arriving at 08.04 can stop additionally at Woodilee and Westerhill
- The Perth to Glasgow Queen St service arriving 08.19 can stop additionally at Woodilee and Westerhill.
- The Aberdeen to Glasgow Queen St service arriving 08.34 can stop additionally at Woodilee and Westerhill.
- The Alloa to Glasgow Queen St service arriving 08.52 cannot stop at Woodilee or Westerhill unless several trains are re-timed.
- The Dunblane to Glasgow Queen St service arriving 09.03 cannot stop at Woodilee or Westerhill.

Page: 4 of 5 Doc. F8/10 Revised: April 2009

- The 16.33 departure from Glasgow Queen St to Lenzie can be extended to Croy with stops at Westerhill and Woodilee.
- The 16.48 departure from Glasgow Queen St to Dunblane can stop additionally at Westerhill and Woodiee
- The 17:03 departure from Glasgow Queen St to Falkirk Grahamston can stop additionally at Westerhill and Woodilee.
- The 17.19 departure from Glasgow Queen St to Alloa can stop additionally at Westerhill and Woodilee
- The 17.33 departure from Glasgow Queen St to Markinch cannot stop at Westerhill or Woodilee unless several trains are retimed.
- The 17.49 departure from Glasgow Queen St to Dunblane can stop additionally at Westerhill and Woodilee

In practice, the provision of peak services is affected by a range of issues including the level of crowding on existing trains and the times at which extra trains and timetable paths are available. While the basic off-peak service pattern is likely to stay broadly similar under electrification, the extra peak services (and extra stops in services that normally do not stop) could change significantly. Hence the results above are no more than indicative of the type of peak provision that might be possible.

### 1.7 EGIP Phase 2 Timetable

We note however that further improvements to the Edinburgh-Glasgow service pattern have been proposed previously as Phase 2 of the Edinburgh-Glasgow Improvement Programme, but are not committed. This scheme would provide six fast Edinburgh-Glasgow trains every hour, but requires various infrastructure improvements to increase route capacity.

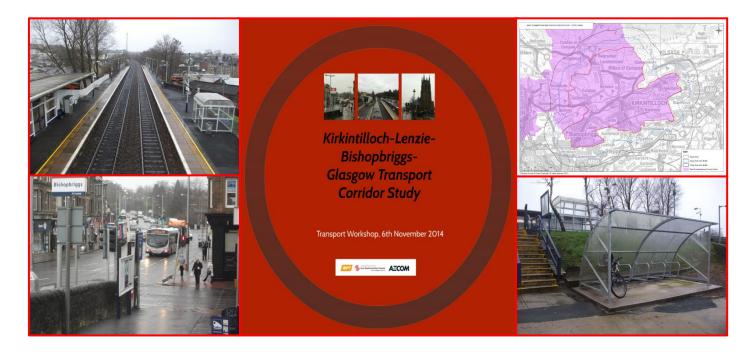

It is evident that even without the extra stops and with the higher performance of electric units, the Stirling local trains cannot be accommodated between Glasgow and Greenhill Upper on a simple double track between Edinburgh trains that run at regular 10min intervals. Since the short wait for a fast train is a key feature of the service pattern, we assume that irregular intervals between fast services would not be acceptable. Hence the proposed infrastructure changes for EGIP Phase 2 would have to include an overtaking facility, preferably comprising a section of parallel slow line in each direction long enough for a fast train to overtake a local train without delaying the latter for more time than its normal station stops. Such a facility would fulfil a similar role for a service making two additional stops, and if one or both of the stops was located on the section of slow line then this slow line might even be shorter than otherwise.

We would therefore recommend that if these two stations are taken forward, the proposed locations should be reviewed against the infrastructure requirements of EGIP Phase 2. If EGIP Phase 2 affects the station design and is a committed scheme by that time, then it would be most cost-effective to defer the new stations to be implemented at or after EGIP Phase 2. Otherwise consideration should be given to making the stations easily modifiable for any EGIP Phase 2 requirements, for example setting the station buildings back from the platform edge and building the platforms from modular elements which allow them to be reduced in width to accommodate future slow lines.

# East Dunbartonshire STAG Multi-Modal Transport Study: Kirkintilloch/Lenzie – Bishopbriggs – Glasgow Corridor

# Part 2 Appraisal Workshop: Summary of Discussions

### 1. Introduction

### 1.1 Purpose of the Workshop

A Transport Appraisal Workshop for the *Kirkintilloch/Lenzie – Bishopbriggs – Glasgow Corridor Multi-Modal Transport Study* was held in Kirkintilloch on the 6<sup>th</sup> November 2014 with representatives of East Dunbartonshire Council and their consultants AECOM. The purpose of the workshops was twofold:

- a) To present a summary of the main outcomes resulting from the work undertaken to date; and
- b) To seek the views of stakeholders on the short list of options emerging from the work to date (STAG 1).

This work is being used to inform a more detailed appraisal of the options carried forward to STAG 2. Application of the outcomes from the workshop is central to the STAG appraisal process.

### Workshop Objectives:

- To share the findings of the STAG Part 1 process; and
- To discuss the short-list of options emerging from STAG Part 1.

### 1.2 Workshop Format

In advance of the workshop, stakeholders who had confirmed their attendance were provided with a Workshop Handbook including various briefing information explaining the purpose of the workshop, background information on the study context and STAG, including the shortlist of options that emerged from the STAG 1 study.

The workshop followed an agenda, as set out below.

Time	Item
09.45 – 10.00	Registration
	Tea / Coffee provided.
10.00 – 10.05	Introduction, Overview and Briefing
10.05 – 10.15	Overview of STAG 1 Outcomes
	Presentation
10.15 – 12.15	Review of Options Emerging from STAG 1
	Presentation
	Workshop Discussion Groups
	Feedback
12.15 – 12.30	Summing Up and Next Steps

A description of the agenda items is presented overpage.

### **Presentation Link**:

The link to the presentation provided during the workshop is set out below:

 Presentation - Kirkintilloch/Lenzie-Bishopbriggs-Glasgow Transport Corridor Study (click here for Prezi) (alternatively, copy and paste the following link into your web browser: http://prezi.com/6rjkovgwejzv/?utm\_campaign=share&utm\_medium=copy&rc=ex0share).

### <u>10.00 – 10.05: Introduction</u>

A short presentation providing an introduction, study overview and programme for the day was set out by AECOM. An introduction and welcome was provided by Alison Laurence, Team Leader - Land Planning Policy at East Dunbartonshire Council.

### 10.05 - 10.15: Overview of STAG 1 Outcomes

AECOM presented a refresh of the key outcomes from the STAG 1 study. This focused on summarising the main problems, issues, opportunities and constraints in the study area, as well as presenting the Transport Planning Objectives (TPOs) and the options considered as part of the STAG 1 appraisal.

### <u>10.15 – 12.15: Review of Options Emerging from STAG 1</u>

A short presentation was provided by AECOM outlining further detail on each of the options being taken forward for further appraisal through the STAG 2 assessment stage. At the end of the presentation, stakeholders split into break-out groups to discuss the shortlist of options. Three break-out groups were convened, comprising stakeholders from a range of backgrounds, with each group facilitated by representatives from AECOM and East Dunbartonshire Council.

For the break-out session, the groups were asked to discuss the following issues:

- Views of stakeholders on each of the options general level of support?
- Assessment of safety, accessibility and integration of each option?
- Any risks to implementation and possible compatibility issues?

Appendix A presents the results from the break-out group discussions.

### 12.15 – 12.30: Summing Up and Next Steps

AECOM concluded the workshop with a short presentation outlining the project schedule going forward and how the work will be used to support the STAG process. AECOM thanked all stakeholders for their input.

### **1.3 Summary of Workshop Outputs**

Representatives from AECOM recorded the various comments made by the stakeholders throughout the workshop, and specifically during the facilitated break-out session.

In Appendix A, all comments from the workshop have been collated for presentation, with common themes identified where appropriate. The information presented reflects the discussion across the break-out groups and will be used to inform the study going forward.

# 2. Workshop Participants

Attendees:	
Name	Organisation
Margaret McNaughton	Bishopbriggs Community Council
Tom Gray	Lenzie Community Council
Tony Miles	Lenzie Community Council
Sydney Sharp	Milton of Campsie Community Council
Hugh Kershaw	Torrance Community Council
Mandy Scott	Aviva
David McDove	North Lanarkshire Council
Vicki Trim	East Dunbartonshire CHP
Margaret Todd	Waterside Community Council
Colin Harris	Kirkintilloch Community Council
Amanda Horn	SPT
Cllr. Alan Moir	East Dunbartonshire Council
Bryan Tennant	SPT
Stevie Neilan	First Bus Glasgow
Chris Hampson	First Bus Glasgow
Fiona Bartels	Freight Transport Association
Chris Campbell	Road Haulage Association
Ken Sutherland	Railfuture Scotland
John MacKenzie	Glasgow City Council
Alex Moore	Police Scotland
Alan Slack	Bishopbriggs Community Council
Richard McKinlay	Go Bike! Strathclyde Cycle Campaign
David Torrance	Transport Scotland
Alan Reid	East Dunbartonshire Council - Roads and Neighbourhood Services
Kathleen McWhirter	East Dunbartonshire Council
Blair Armstrong	Strathblane Community Council
Alison Laurence	East Dunbartonshire Council
Ewan Wilson	East Dunbartonshire Council
Eleanor Bagnall	AECOM
Richie Fraser	AECOM
Manuel Ruiz	AECOM
Richard Hernan	AECOM
Stephanie Thompson	AECOM

### 3. Going Forward

### 3.1 Next Steps

In terms of next steps, AECOM and East Dunbartonshire Council will analyse the outcomes from the workshop and any further comments that are received to inform the more detailed appraisal of the short list of transport options within the STAG multi-criteria framework.

STAG Part 2 Appraisal involves a detailed appraisal of the options taken forward from the Part 1 appraisal with specific consideration to the Government's objectives (Environment, Safety, Economy, Integration, Accessibility and Social Inclusion), cost to government, monitoring and evaluation, and risk and uncertainty.

Based on the appraisal findings, a STAG Part 2 Report will be submitted to East Dunbartonshire Council for further consideration.

# Appendix A: Options Emerging from STAG 1 Discussion

Project:	EDC STAG 2 - A803/A806 (Kirkintilloch/Lenzie- Bishopbriggs-Glasgow) Route Corridor Study	Job No:	60331121
Subject:	Workshop Notes of Discussion (6/11/14)	Date:	06 November 2014
Prepared by:	AECOM		

OPTION	COMMENTS
	• Problems with HGV double parking (although it was acknowledged that in some cases they have nowhere else to go). It was felt that the width and access required by delivery lorries was not addressed during the design phase of roads.
	It was stated that residents of Lennoxtown and Torrance depend on private vehicles due to the following:
	- Lack of bus based park and ride facilities;
	- Timetables are not convenient;
2) Quality Bus Corridor Package	- There is no other access from Torrance to the A803 by alternative modes to car, particularly during the AM peak period.
	• No alternative route from Bishopbriggs to Glasgow other than through Bishopbrigg Cross, causing a gridlock at this area. It was felt delivery of the BRR would ease congestion at this point. It was also confirmed that peak time services going into Glasgow is when congestion is at its most severe and measures should be focused on the city-bound journeys.
	• Concern that implementation of bus lanes would have a negative impact on traffic at key junctions, particularly in the vicinity of Bishopbriggs town centre (for example, at the South Crosshill Road junction).
	• It was believed there may be physical constraints in retrofitting a bus lane into the existing road corridor and it was

	strongly felt that bus lanes in both directions would not be possible, nor necessary.
•	It was felt that there would likely be greater public acceptability to this option if it did not overly penalise motorists e.g. only operational at peak times and at key pinch points.
•	Parking along the A803 creates problems during peak periods.
•	The health benefits of promoting public transport were recognised (e.g. walking to bus stops) although services must be convenient and costs must be appropriate for services to be attractive to users.
•	An express bus to Glasgow was suggested – it was noted that there already is one, but does not operate during the AM peak.
•	The need for a possible Park & Ride at Torrance Roundabout was raised.
•	Consideration would require to be given to parking for the mobility impaired if a bus corridor is implemented.
•	Generally considered that any improvements to bus service provision would be welcome – for example, upgraded shelters, provision of real time information, wider availability of timetable information, etc.
•	Consideration to be given to provision for cyclists. A dedicated cycle lane would be favourable.
•	Extending the QBC corridor beyond the Glasgow City Council boundary would enhance the impacts of this option. It was acknowledged that the Glasgow SQP currently operates up to the boundary.
•	General appetite for this option amongst bus operators and transport bodies. It was noted by a number of consultees that such an option could be delivered a lot sooner and cheaper than rail stations.
•	It was acknowledged that the full benefits of this option would be achieved after delivery of the BRR and a QBC should be seen as complementary to the BRR to lock in the benefits.
•	It was suggested that this option could concentrate on pinch points on the A803, rather than along the whole route (i.e. a phased QBC at certain points along the A803 as opposed to continuous bus lanes).
•	Opportunity to introduce electric buses or hybrids as part of this option. Bus operators mentioned that upgrade of vehicles is already happening outside this option.
•	If this option achieves reduced congestion levels through Bishopbriggs, it would have a positive economic impact

	on the town centre.
	• It was generally felt that improvements to general traffic flow and movement would have a knock-on benefit to bus journey times, rather than specific bus lanes. One method discussed was the introduction of 2 southbound lanes and one northbound. This could incorporate closing some roads which junction with the A803.
	It was suggested that enhancement of boarding facilities at Bishopbriggs would be welcome.
	• The point of parking around Arnold Clark was raised, and there was general acceptance to the concept of removing parking to provide bus facilities. However, it was acknowledged there are some flats along the A803 near Colston Road which have limited off road parking therefore they may need some sort of parking allowance.
	• Generally the idea of consolidating bus stops was seen as a good idea - as long as it didn't disenfranchise people and thought would need to be given to DDA compliance and social inclusion.
	<ul> <li>It was thought that an appropriate location to situate a bus hub in the town centre did not exist, and delivering this option would only add congestion to the town centre. Instead, it was generally felt that there was not enough information on existing bus services. Simpler measures such as improved shelters and facilities, wider pavements, better ticketing systems, real time information at bus stops and the general creation of a more pleasant environment would add greater value.</li> </ul>
	• Some participants stated that local bus stops should remain as they are, as people would not like to walk further to a hub. Consideration should be given to the ageing population within the study area.
	Buses should be located where people need to go.
3) Kirkintilloch Bus Hub	• Concerns were raised on how delivery vehicles would gain access to shops in the town centre if such a hub was to be built.
	• It was acknowledged that if improvement measures should tie up with the Kirkintilloch Town Centre Masterplan.
	Bus operators highlighted that essentially there are already two existing bus hubs in Kirkintilloch town centre for buses coming from/leaving to Glasgow: Catherine Street and Townhead, respectively.
	• An option like this should consider remote communities in the study area such as Lennoxtown and Milton of Campsie.
	Care should be taken to ensure that any option does not encourage people to travel out of Kirkintilloch to access

	-	
		services elsewhere, thus having a negative impact on the economic vitality of the town centre.
	•	It was considered that the rationalisation of bus stops and creation of a bus hub would only benefit those with real mobility issues.
	•	If a certain degree of modal shift was achieved, it was anticipated that such a facility would help to mitigate rail overcrowding issues. To encourage this modal shift to bus, possible alterations to timetables were suggested, particularly during peak periods.
	•	It was suggested that this option could incorporate both express services into Glasgow and shuttle buses to Lenzie train station (i.e. a two in one Park & Ride concept).
	•	It was queried whether the Park & Ride at Robroyston would attract users from East Dunbartonshire. The general view was that both options are complementary, as they attract demand from different catchment areas.
A) Due Dark & Dide ediscent to / in	•	The issue of the Park & Ride being located too close to the motorway was raised, as it may discourage commuter drivers to make use of it. However, it was argued that the cost of parking in Glasgow city centre could increase the appeal of this option for some commuters. Further to this, it was noted that drivers currently exit motorway to park at Lenzie rail station – so the trend could be similar for the proposed Park & Ride facility.
4) Bus Park & Ride adjacent to / in the vicinity of KLR and associated Bus Priority	•	Option generally felt to be attractive (particularly by bus operators and transport bodies) as there is already an existing bus network along the KLR connecting Kirkintilloch and Glasgow. It was felt that existing services could easily call at this Park & Ride facility and satisfy increased demand. In this sense, the location of the Park & Ride was considered key – the site should be located to ensure that existing bus services do not have to deviate and hence travel time to Glasgow remain unaffected.
	•	Potential for other measures (similar to a bus based Park & Ride) to be developed. Specifically, two bus stops located in the KLR (A806) – Woodilee Road junction were proposed. These could serve demand from the Woodilee village, and could accommodate stops from express services such as the X86.
	•	It was raised that such a facility would be subject to reasonable demand, as there is currently unofficial park and ride taking place at the Kirkintilloch Leisure Centre and at Beechmount Road (which may come to an end when decriminalised parking. Further to this, it was suggested that the site at Lenzie Hospital would be seen as a good location with good accessibility.
	•	The cost of bus fares and reliability of services are key to ensuring the service is attractive.

	•	Security issues must be considered, particularly if the facility / bus services are to be used out of hours. Consideration requires to be given to on-board safety, in addition to the bus stop waiting environment and car park environment. Option considered attractive for commuter trips, but non-peak time services are also important.
	•	It was mentioned that North Lanarkshire Council (NLC) has an aspiration for a bus Park & Ride facility adjacent to the M80 at junction 3, about one mile south of Lenzie. It was stated this may be taken forward as part of Citydeal – if delivered, this could impact the potential demand for this Park & Ride option.
	•	The general view was that there is only demand at the Westerhill site during peak periods - therefore, this Park & Ride facility would likely be less effective than Option 4. However, it was argued by some that this option would be complimentary to Option 4 as it would be a key driver of economic development at Westerhill and may attract other businesses into the area.
	•	Concerns were raised regarding the use of this facility as an overspill car park by the people who work at Westerhill. This would have to be enforced – proposed measures included the idea of a ticket barrier, which would only allow those with a bus ticket to access the car park.
	•	It was stated that this option may ease congestion through the A803 as it may attract residents from remote communities (i.e. Lennoxton, Torrance, Milton of Campsie) who are travelling into Glasgow.
5) Bus Park & Ride adjacent to the BRR and associated Bus Priority	•	The transfer of trips from car to bus would help reduce congestion on the A803 which could increase accessibility through Bishopbriggs town centre, reduce parking problems and increase access to locations such as Stobhill Hospital.
	•	The success of this option would depend on the full delivery of the BRR and on how access to the Park & Ride facility is provided. Additional measures such as signage for active travellers using the facility would be welcome (i.e. signs indicating Bishopbriggs town centre).
	•	It was queried whether the Park & Ride proposal for Robroyston would attract users from East Dunbartonshire. The general feeling was that both options are complementary, as they attract demand from different catchment areas. It is considered that there is a psychological barrier to crossing the M80, and people from the more rural parts of East Dunbartonshire in particular would not bypass a local Park & Ride site to get to Robroyston.
	•	Successful implementation of this option would be dependent upon the frequency of bus services (10 minute peak

	-	
		service favoured), bus routing (it was suggested that service number 88 could divert), availability and accuracy of timetable information, and access for pedestrians and cyclists.
		It was stated that bus journey times between the Westerhill site and Glasgow would be constrained by delays on the M80 and would never be competitive with rail - therefore there was concern about the viability of a bus Park & Ride at this location.
	•	Regarding existing express services, it was mentioned that it would be unlikely that the X91 service which serves the area south of Westerhill would continue to a bus Park & Ride facility due to routing and journey time issues.
	•	The main issue raised was whether there would be public demand to generate such a service, with it being suggested that this may be an area where community transport services could assist. There were also question marks over the funding of this option.
	•	Anecdotal evidence suggested that demand for an existing loop service run by Kirkintilloch Community Council is not very high.
	•	It was suggested that the bus loop could help local trade gain access to local amenities such as doctor's surgery. Provision of such a service, coupled with existing parking issues in the area, may achieve a degree of modal shift from car.
6) Bus Service Improvements and	•	Consideration should be given to extending the service to the outlying villages, including Lennoxtown.
New Services (including	•	There was discussion about bespoke bus services including hospital services which typically require high subsidy.
Kirkintilloch / Lenzie Loop Bus)	•	If it were to be implemented, it was believed that a loop service would allow passengers to access Lenzie train station, addressing current parking problems at this station. It was also felt that such a service could be popular during off peak times amongst residents, who could use it for local trips.
	•	Integrated ticketing would make this option more attractive for those interchanging at Lenzie Rail Station (i.e. a combined bus / rail ticket).
	•	A 10-minute service frequency would be desirable – i.e. "turn up and go" – such that users could be confident of getting to Lenzie Rail Station in adequate time.
	•	Consideration to be given to whether Lenzie Rail Station and the rail network in general could support the additional patronage this option may generate.

	•	Key risks to the successful implementation of this option relate to financial viability and patronage demand.
	•	It was felt that the existing buses do link directly (or with one change) to Lenzie station – however, people continue to drive to the station, so it was felt unlikely that this behaviour would change significantly by implementing this option.
	•	Some consultees suggested that increased parking provision at Lenzie would attract more traffic into the area, contributing to already existing congestion issues around Lenzie station. Additional parking could have a 'honeypot' effect. It was felt that the number of spaces being considered as part of this options (approximately between 100 – 200) would be insufficient to fully satisfy parking demand, and that overspill parking on nearby residential streets would continue to be an issue or even worsen due to increased traffic flows.
	•	Suggestion of undertaking a household survey in the Lenzie / wider Kirkintilloch area to identify suppressed demand at Lenzie rail station.
	•	Strong opposition to the decking option, as it was felt it would generate a negative visual impact. Environmental concerns were also raised regarding the surface option.
7) Increase Parking Provision at	•	The potential reduction of recreational green space associated with extending parking at the surface level was not supported.
Lenzie Rail Station	•	Improved cycle parking at the station was recommended to encourage access by sustainable modes. However, concerns regarding safety at the station (CCTV cameras, lighting, appropriate bike lockers) and accessing the station (suitable cycleways / paths) were raised.
	•	It was considered that wider improvements could be taken forward for the stations, such as an improved drop-off area, limited time parking and enhanced bus stopping area.
	•	It was felt that there could be greater opportunity to encourage more local trips to the station to be made by active travel.
	•	Consideration requires to be given to how many bicycles can be accommodated on-board the rail services – limited merit in improving cycle access if bicycles cannot be accommodated on the trains.
	•	It was highlighted that the Council are to introduce parking / waiting restrictions on roads nearby existing car parks where there is a historical issue of overflow parking being displaced on local roads. The aim of this measure is to discourage people parking in local roads - waiting restrictions within the vicinity of Lenzie station will be extended

	T	han afully an accuration many local station years to year austrinable mades
		hopefully encouraging more local station users to use sustainable modes.
	•	There were concerns that delivering a new rail station at Woodilee may have to be at the expense of Lenzie station given their close proximity. Generally it was suggested that the Woodilee station should be assessed as a complementary station to Lenzie. The importance of providing people with travel choices was noted.
	•	It was noted that the Edinburgh Glasgow Improvement Programme (EGIP) will deliver increases in capacity of 30%, as well as electrification of the rail line (leading to faster trains). Greater consideration should be given about how to maximise the opportunity this will provide at existing stations.
	•	Some considered that there would be scope in delivering a new rail halt following electrification of the rail line (which will deliver faster trains).
	•	There was general support for this rail station to be delivered together with a Park & Ride facility.
0) Develop o New Deil Helt of	•	It was suggested that this station could be connected to the town centre with loop buses.
8) Develop a New Rail Halt at Woodilee (with Park & Ride) & Promote Sustainable Access	•	Concerns were raised about rail users possibly using Woodilee station instead of the other stations in the area (i.e. Lenzie and Bishopbriggs), simply to access trains before other passengers and to be able to get a seat i.e. heightening problems of overcrowding down the line.
	•	Examples were highlighted from elsewhere where the delivery of a new rail halt can have positive impacts on house prices, increasing their value by up to 20 – 25%.
	•	There was a suggestion to close Lenzie station and create a "mega station" at Woodilee. However, it was noted that people could not walk from Lenzie to Woodilee and that such a measure would be likely to exacerbate traffic levels in the local area.
	•	It was felt that a station at Woodilee would require to operate all day, and not only during peak periods as people could be uncertain about when they would make their return journeys. Perhaps a reduced day time service would suffice.
	•	Access for cyclists must be considered.
9) Develop a New Rail Halt at Westerhill (with Park & Ride) & Promote Sustainable Access	•	It was suggested that providing a rail station at Westerhill would be attractive for businesses established in the area. In addition, increased accessibility provided by the halt would possibly attract other businesses to the Westerhill site, generating economic development in the area.

	It was identified that the Ediph with Classes Improvement Dreamon (ECID) will deliver increases in conseits of
•	It was identified that the Edinburgh Glasgow Improvement Programme (EGIP) will deliver increases in capacity of 30%, as well as electrification of the rail line (leading to faster trains).
•	There was general support for this rail halt to be delivered together with a Park & Ride facility.
·	It was considered that a station in this location could alleviate parking problems in Bishopbriggs town centre, having a positive impact on air quality.
•	Some consultees felt that the proposed Park & Ride at Robroyston would not affect demand for a station at Westerhill, as Robroyston is too far away. They were seen as complementary measures which could potentially be delivered in conjunction with each other. Others felt that if decriminalisation leads to a loss of on-street parking around Bishopbriggs Station, this could lead to current users of Bishopbriggs choosing Robroyston station instead.
•	It was suggested that a rail halt at Westerhill could enhance access for visitors to the HM Prison at Low Moss.
•	It was considered that full implementation of the BRR would enhance but not preclude the successful implementation of this option.
•	It was felt that a station at Westerhill would require to operate all day and not only during peak periods due to the large number of residential properties and businesses in the vicinity of the proposed rail station, and as people could be uncertain about when they would make their return journeys. Perhaps a reduced day time service would suffice.
•	There was a feeling that if new stations are to be introduced, they should have been done so at the time of major development in these areas and perhaps this opportunity has been missed, particularly given potential deliverability and capacity constraints associated with implementing new stations on this rail line.

As an additional task, at the end of each break-out session attendees were asked to rank their top three options. This exercise was undertaken to gain a high level snapshot of stakeholder's views of the different options, which are listed as follows:

- Option 2 Quality Bus Corridor Package;
- Option 3 Kirkintilloch Bus Hub;
- Option 4 Bus Park & Ride adjacent to / in the vicinity of KLR and associated Bus Priority;
- Option 5 Bus Park & Ride adjacent to the BRR and associated Bus Priority;
- Option 6 Bus Service Improvements and New Services (including Kirkintilloch / Lenzie Loop Bus);
- Option 7 Increase Parking Provision at Lenzie Rail Station;
- Option 8 Develop a New Rail Halt at Woodilee (with Park & Ride) & Promote Sustainable Access; and
- Option 9 Develop a New Rail Halt at Westerhill (with Park & Ride) & Promote Sustainable Access.

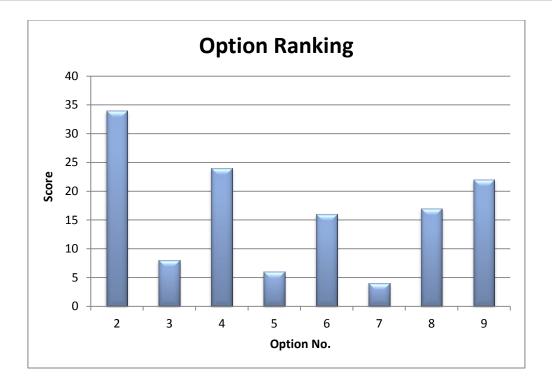

The results across the three groups are illustrated in the graph below:

In order to represent the performance of each option in a more concise manner, a scoring system was applied to the previous exercise, as follows:

- Three (3) points were given to an option every time it was ranked as first.
- Two (2) points were given to an option every time it was ranked second.
- One (1) point was given to an option every time it was ranked third.

This methodology provided an overall score for each option, which is presented overleaf.

Background Information				
Geographic Context: East Dunbartonshire is located to the north of the city area of Glasgow and covers an area of approximately 17,000ha. The study area for this commission is the Kirkintilloch/Lenzie-Bishopbriggs-Glasgow corridor, with key transport infrastructure within the area comprising Bishopbriggs and Lenzie rail stations, National Cycle Routes 754, the A803, A806 and Bishopbriggs Relief Road. The area is home to over 50,000 people and comprises a mix of commuter towns and villages from larger settlements such as Bishopbriggs and Kirkintilloch to smaller villages such as Milton of Campsie and Lennoxtown at the foot of the Campsie Hills.				
Social Context:	The main settlements in the study area are Bishopbriggs (23,118), Kirkintilloch (20,281) and Lenzie (8,873). In terms of employment, 80.3% of East Dunbartonshire's population was economically active during 2013, with 77.2% in employment. With an average weekly wage of £594.10 (as of 2013), East Dunbartonshire is one of the most affluent communities in Scotland, with wages being significantly higher than the			

		Scottish (£508.00) and British (£518.10) national averages. East Dunbartonshire has one of the highest car ownership rates in Scotland. As a result, car usage within the study area is high and sustainable / active travel is low. Despite being a generally affluent area, the Scottish Index of Multiple Derivation (SIMD 2012)1 shows there are certain pockets in the study corridor (particularly around Kirkintilloch) where the level of deprivation is between the 20-40% National 2012 Quintiles.				
Economic Context: mainly located within their town (home to major employers such also identifies major developmen			and Kirkintilloch are the economic centres of the study area. Each has significant levels of retail activity, centres. In terms of key commercial developments, the most important ones are Westerhill Business Park as Aviva) and Strathkelvin Retail Park (home to a large number of retail chains). The Council's Local Plan 2 t proposals within the study area, which are either under construction or have consent granted and therefore lelivered. These include Woodilee (800+ units), Bishopbriggs East (250+ units) and Lennox Castle Hospital			
Pla	nning Objectives					
Obj	jective:		Performance against planning objective:			
	<ul> <li>to key attractors outside of the study area, particularly commuting journeys.</li> <li>2. Improve public transport journey times and journey time reliability through the study area.</li> <li>3. Improve accessibility by sustainable transport modes to key trip attractors within the study area.</li> <li>4. Deliver a transport network that supports improvements to human health and air quality, while minimising the impact on the environment.</li> </ul>		Minor Negative Impact (-1): While a number of the interventions proposed under the Do Minimum scenario could provide greater priority to public transport and other sustainable modes, on the whole the overall impact on this objective is considered to be minor negative. Full delivery of the BRR is likely to encourage increased car trips in the absence of any measures to lock in the benefits of the additional road capacity provided by the route. Neutral / No impact (0):			
			Evidence <sup>1</sup> suggests full delivery of the BRR is expected to reduce traffic on the A803 by 20%, although in the absence of measures to lock in the benefits of the additional road capacity there is a risk that this benefit could be eroded. SCOOT is anticipated to support reduced traffic delays in the study area although additional bus priority at these junctions would be required to ensure that improved public transport journey times and journey time reliability are secured.			
3.			<i>Neutral / No impact (0):</i> The Do Minimum does not propose any significant interventions to promote sustainable travel within the study area.			
4.			Minor Negative Impact (-1): In the absence of measures to promote active or sustainable travel, improvements to human health and air quality are unlikely. Air quality problems through Bishopbriggs may be reduced as a result of lower traffic flows on the A803 owing to the full BRR construction, although in the longer-term induced traffic associated with the additional road capacity could erode any benefits in the absence of measures to lock in the

	bei	enefits.		
<ol> <li>Provide a sustainable transp development, regeneration a sustainable economic growt</li> </ol>	and contributes to the Pro h of the study area.	Neutral / No impact (0): Proposed measures such as EGIP Phase 1 and the BRR would contribute to delivering an enhanced network and may support local development. The level to which this network is sustainable, however, is questionable and would need to be further defined.		
Rationale for Selection or Rejection of Proposal:		problems and oppo	ntions that will enhance the transport network withir rtunities of this study. It is used through the STAG ap	
Implementability Appraisal				
Technical:		n of some elements	d schemes and is therefore considered to be technical of the Do Minimum, for example the BRR. There are in ation of the Do Minimum.	
Operational:	Increased future road congestion, alongside insufficient measures to encourage modal shift away from private car, are key factors which will adversely affect the ability to successfully operate the Do Minimum scenario in the longer-term.			
Financial:	The Do Minimum comprises measures which are committed and have funding secured. It is likely to be funded through a combina developer contributions, local authority investments, SPT investment, and potentially Scottish Government support and European There are no operating subsidies associated with the Do Minimum.			
Public:			o manage congestion along the A803 corridor.	
Environment				
Mitigation Options Included: (Costs & Benefits)	Mitigation approaches outlined in	ו SEA.		
Sub-criterion	Qualitative Information		Quantitative Information	Significance of Impact
Noise and Vibration	It is likely that noise and vibration the Do Minimum will not be signifi likely be of greatest magnitude du construction of new infrastructure BRR.	ficant. Impacts will uring the	Those at greatest risk to increased disturbance are residents within Bishopbriggs East and industry and businesses based at Westerhill Business Park which will experience construction and increased traffic noise from the BRR. Adequate mitigation measures will be established at project level, with residual effects from noise and vibration not likely to be significant.	Minor Negative

	· · · · · · · · · · · · · · · · · · ·		
Global Air Quality – CO <sub>2</sub>	Given the scale of the study area, and the level to which any modal shift will be achieved from the development of these Options, global air quality is not predicted to be significantly impacted upon.		Negligible
Local Air Quality – $PM_{10}$ and $NO_2$	Full construction of the BRR is anticipated to generate induced traffic, which would attract more vehicles into the study area. This would have a detrimental environmental impact associated with increased vehicle emissions.	Those at greatest risk are residents within Bishopbriggs who will experience construction pollution and increased traffic volumes during operation of the BRR. Adequate mitigation measures will be established at project level, with residual effects on air quality not likely to be significant.	Minor Negative
Water Quality, Drainage and Flood Defence	The development of the Do Minimum is not predicted to result in any impacts on the water environment. Where impacts on the water environment may occur will pertain to potential reduced water quality from pollutants and potential contaminants from construction entering water courses through surface runoff.	Watercourses within closest proximity to any construction works are limited to the Forth and Clyde Canal in Kirkintilloch. As the various components of the Do Minimum have been approved, any predicted impacts are assumed to have been mitigated to an acceptable level.	Negligible
Geology	Ground investigation / earthworks create potential for ground contamination and / or creation of pollution leakages.	There are no sensitive geological receptors within the study area; any impacts on geological resources are not likely to be significant.	Neutral
Biodiversity	There is land take and habitat removal required to accommodate some interventions within the Do Minimum. Subsequently habitat for protected species such as bats, breeding birds and badgers may be lost or disturbed.	There is an area of woodland listed within the Ancient Woodland Inventory located to the north of the BRR. No other protected sites or designations will be impacted as a result of the Do Minimum. All potential impacts on biodiversity are predicted to have been mitigated to a level that is not significant.	Minor Negative
Landscape & Visual Amenity	The introduction of a new transport corridor (the BRR) within the landscape has the potential to result in adverse effects on the landscape/ townscape and visual amenity of the area. The likelihood of impacts on landscape and visual amenity will increase should natural screening such as established planting be removed.	There are not predicted to be any significant impacts on the landscape or visual amenity from the Do Minimum scenario as the projects developed within this Option will have been determined not to have a detrimental impact in order to receive consent.	Negligible
Agriculture and Soils	Impacts on agriculture are likely to occur should new infrastructure result in the loss or severance of	Land adjacent to the proposed BRR is regarded as being of Class 3.2 – capable of supporting mixed	Minor Negative

	agricultural land.		agriculture.

Proposal Description:	This option involves the development of a Quality Bus Corridor (QBC) in partnership with operators and SPT along the A803, to provide measures to	Total Public Sector Funding Requirement:	Capital costs/grant: £1,296,000 (undiscounted) (There are multiple potential measures relating to the QBC package - the cost provided relates to a comprehensive and wide-ranging package of measures)			
	improve bus journey times and journey time reliability for all bus movements on this corridor.		Annual revenue support: N/A			
			Present Value of Cost to Govt: £1,024,000			
Funding Sought From: (if applicable)	Not yet known	Amount of Application:	Not yet known			
Background Information						
Geographic Context:	Geographic Context: East Dunbartonshire is located to the north of the city area of Glasgow and covers an area of approximately 17,000ha. The study area for this commission is the Kirkintilloch/Lenzie-Bishopbriggs-Glasgow corridor, with key transport infrastructure within the area comprising Bishopbriggs and Lenzie rail stations, National Cycle Routes 754, the A803, A806 and Bishopbriggs Relief Road. The area is home to over 50,000 people and comprises a mix of commuter towns and villages from larger settlements such as Bishopbriggs and Kirkintilloch to smaller villages such as Milton of Campsie and Lennoxtown at the foot of the Campsie Hills.					
Social Context:	The main settlements in the study area are Bishopbriggs (23,118), Kirkintilloch (20,281) and Lenzie (8,873). In terms of employment, 80.3% of East Dunbartonshire's population was economically active during 2013, with 77.2% in employment. With an average weekly wage of £594.10 (as of 2013), East Dunbartonshire is one of the most affluent communities in Scotland, with wages being significantly higher than the Scottish (£508.00) and British (£518.10) national averages. East Dunbartonshire has one of the highest car ownership rates in Scotland. As a result, car usage within the study area is high and sustainable / active travel is low. Despite being a generally affluent area, the Scottish Index of Multiple Derivation (SIMD 2012)1 shows there are certain pockets in the study corridor (particularly around Kirkintilloch) where the level of deprivation is between the 20-40% National 2012 Quintiles.					

Eco	onomic Context:	Context: The settlements of Bishopbriggs and Kirkintilloch are the economic centres of the study area. Each has significant levels of retail activity mainly located within their town centres. In terms of key commercial developments, the most important ones are Westerhill Business Park (home to major employers such as Aviva) and Strathkelvin Retail Park (home to a large number of retail chains). The Council's Local Plan 2 also identifies major development proposals within the study area, which are either under construction or have consent granted and therefore have a high likelihood of being delivered. These include Woodilee (800+ units), Bishopbriggs East (250+ units) and Lennox Castle Hospita Site (350+ units).				
Pla	Inning Objectives					
Obj	jective:		Performance against planning objective:			
1.	Promote modal shift to sust for trips to key attractors ou particularly commuting journ	itside of the study area, neys.	Moderate Positive Impact (+2): A QBC scheme along the A803 would be expected to improve public transport options within the study area (and the perception of public transport in general) and the attractiveness of services to/from Glasgow, which in turn could have a moderate positive impact in terms of promoting modal shift for commuter trips both within and outside of the study area.			
2.	Improve public transport jou time reliability through the s	study area.	Moderate Positive Impact (+2): Delivery of a QBC would likely involve a number of measures designed to give greater priority to public transport services, such as potential road widening, dedicated carriageway space for buses and priority at junctions. As a result, bus journey times through the study corridor would be reduced (buses would operate on a less constrained network) and journey time reliability for passengers would be improved.			
3.	Improve accessibility by sus to key trip attractors within t	the study area.	<i>Minor Positive Impact (+1):</i> The option would be expected to have a positive impact on public transport accessibility within the study area, as a result of faster journey times for buses along the A803, which would allow people to reach key locations along the corridor quicker.			
4.	Deliver a transport network improvements to human he minimising the impact on th	alth and air quality, while le environment.	Moderate Positive Impact (+2): Option seeks to promote increased public transport patronage, which in turn should have a positive impact in terms of human health. If a degree of modal shift from the car is achieved (as a result of increased bus usage), the option could also contribute to local air quality improvements. In addition, the option proposes measures such as improving bottlenecks which would further contribute to improved air quality on this congested network, parts of which are designated as an Air Quality Management Area.			
5.	Provide a sustainable trans local development, regener the sustainable economic g	ation and contributes to prowth of the study area.	Moderate Positive Impact (+2): Improvements to public transport would be expected to support local development by increasing the attractiveness of the study area for employment and promoting a modal shift which in turn could increase journey time reliability for travelers along the A803, delivering benefits for local residents and business travel.			

Rationale for Selection or Rejection of Proposal:	Overall this option performs strongly against the plannir Option is expected to achieve modal shift and reduce th					
Implementability Appraisal						
Technical:	This proposal is considered to be technically feasible, the QBC measures.	with no untried technologies. There may be disrupt	ion to traffic during implementation of			
	If roadspace priority is afforded to public transport it through already constrained networks, unless future p		local traffic movements, particularly			
Operational:	Will require public transport patronage levels to at le projected life. Should additional buses be required as There will be a requirement to maintain the QBC meas	a result of substantial patronage increases, there	will be associated operational costs			
Financial:	Option would likely be funded through a combinatio Government funding.	n of local authority investment, SPT funding, loca	I bus operator funding and Scottish			
Public:	The consultation process revealed that measures which encourage modal shift, promote public transport, relieve congestion and influence travel behavior would receive support from key stakeholders. Consultation suggested that implementation of the A803 bus quality corridor package of measures are only likely to be publically acceptable following full completion of BRR. Some may question any adverse impacts on local traffic movements if roadspace priority is afforded to public transport, particularly through already constrained networks. Likely to be greater public acceptability to this Option if sections of bus lane do not overly penalise motorists e.g. only operational at peak times and at key pinch points. Generally considered that any improvements to bus service provision and waiting environment would be welcome. General appetite for this Option amongst bus operators and transport bodies.					
Environment						
Mitigation Options Included: (Costs & Benefits)	Mitigation approaches outlined in SEA.					
Sub-criterion	Qualitative Information	Quantitative Information	Significance of Impact			
Noise and Vibration	Changes to service patterns on existing routes are unlikely to have significant effects for noise and vibration.	Reduction in noise from improved traffic flow along the A803 between Torrance Roundabout and Colston Road. The level of noise reduction is dependent on projected traffic flow volumes, however this is unlikely to be significant.	Negligible			
Global Air Quality – CO <sub>2</sub>	Given the scale of the study area and the level to which any modal shift will be achieved from the development of this Option, global air quality is not		Negligible			

	predicted to be significantly impacted upon.		
Local Air Quality – $PM_{10}$ and $NO_2$	Improvements in traffic flow would result in improved local air quality, assuming that the bus priority measures do not adversely affect other road users. Wider emissions reductions would occur from reduced stop-start traffic flow conditions and modal shift to buses, though more traffic may be generated in the long-term as a result of the improved journey times along this route. Both of these changes are reliant upon bus priority measures not affecting other road users too greatly (e.g. if bus priority is too strong, then this may cause increased stop-start conditions for other vehicles).	Local air quality improvements would benefit the area local to the A803 corridor and the conditions within the Bishopbriggs AQMA. The reduction of emissions is dependent on project traffic flow volumes, however this is not predicted to be significant.	Negligible
Water Quality, Drainage and Flood Defence	QBC measures will have no impact on water quality, drainage or flood defences.		Neutral
Geology	Providing a better quality of bus service will not impact upon geology.		Neutral
Biodiversity	Should the development of this Option result in a modal shift to more sustainable transport, it is likely that there will be improved local air quality. As a result of this there may be improved biodiversity within local habitats.	Any predicted beneficial impacts on biodiversity or habitats would be within the immediate vicinity of the A803 corridor. These effects are not predicted to be significant.	Negligible
Landscape & Visual Amenity	A modal shift from private vehicles to buses will have limited impact on the surrounding landscape or visual amenity. Reduction of volumes of traffic on the route could reduce visual impacts from exhaust plumes.		Neutral
Agriculture and Soils	There is no land take associated with this Option, therefore there will be no impact on agriculture or soils.		Neutral
Cultural Heritage	The creation of a quality bus corridor on this route is not likely to result in any impacts on cultural heritage assets.	<ul> <li>It should be noted that along the A803 corridor there are:</li> <li>Three listed buildings;</li> <li>The Coltpark Avenue/Stuart Drive Conservation Area;</li> <li>Balmuildy/Kirkintilloch Road Conservation Area; and</li> <li>The northern section of the route is located</li> </ul>	Negligible

	within the Antonine Wall WHS buffer zone.					
	Careful consideration of each of these assets is					
		required when designing the scheme.				
Monetised summary	Not determined					
Monetary Impact Ratio	Not determined					
Safety						
Sub-criterion	Item	Qualitative Information	Quantitative Information			
Accidents	Change in Annual Personal Injury Accidents	The introduction of Quality Bus measures would potentially smooth out traffic flow and reduce link speeds, which is expected to have a beneficial impact on Personal Injury Accidents. This Option could also possibly reduce the number of road casualties by removing cars from the road network, but this effect will depend on the degree of modal shift generated from private modes.	Minor positive impact			
	Change in Balance of Severity	Smoother flow of traffic (through modal shift from private car) would see a reduction in link speeds which should in turn result in a reduction in the severity of accidents	Minor positive impact			
	Total Discounted Savings		+£5,160			
Security		Public transport facilities would be designed in accordance with current good practice and standards to ensure that all aspects of passenger safety are allowed for wherever possible.	Moderate positive impact			
Monetised summary		Not determined				
Monetary Impact Ratio		Not determined				
Economy (Transport Econ	omic Efficiency)					
Sub-criterion	Item	Qualitative Information	Quantitative Information			
User Benefits	Travel Time	Travel time savings are the main source of TEE benefits delivered under this Option. This benefit is primarily borne by public transport users who will benefit from improved bus journey times.	£33,300,000			
	User Charges	-	£123,000			

	Vehicle Operating Cos		be a slight reduction in operating idling in traffic and less stop / start	£964,000	
	Quality / Reliability Benefits	Improved priority for buses a improved bus journey time r	along the route should deliver eliability.	Journey time surveys undertaken between the stop in proximity to Strathkelvin Retail Park and the stop in proximity to Stobhill Road (both on the A803) suggest an average journey time during the peak period for a southbound trip of 13 minutes and 48 seconds.

Economy (Economic Activity and Location Impacts)					
Sub-criterion It	em	Qualitative Information		Quantitative Information	

	<b>_</b>			
Economic Activity and Location Impacts	Local Economic Impacts	oppo corr by ir alon ecor	Option will help to support local economic development ortunities on the Kirkintilloch / Lenzie – Bishopbriggs – Glasgow idor through a contribution of managed congestion brought about ocreased accessibility, and improved journey times particularly g the A803 corridor. In addition, this Option may have wider nomic impacts through improving public transport and essibility to Glasgow.	N/A
	National Economic Impacts	inclu act a com	re will be small employment gains in the wider study area uding Glasgow, Bishopbriggs and Kirkintilloch. The Option will as a fundamental 'building block' in the continuing petitiveness of East Dunbartonshire, and Glasgow, as strategic stment locations.	N/A
	Distributional Impacts	mar	proposal will contribute at the National level to improving labour ket flexibility and movement, and thus availability, particularly in Glasgow, Bishopbriggs and the Kirkintilloch area.	N/A
Integration				
Sub-criterion	ltem		Qualitative Information	Quantitative Information
Transport Interchanges	Services & Ticketing		This Option provides a range of bus priority measures on the A803 between the Torrance Roundabout and Colston Road junction, which will improve integration between modes, enhance accessibility of the public transport network, and reduce reliance on private car use. However, there are no new bus services proposed within this Option.	Minor positive impact
	Infrastructure & Informatio	'n	This Option provides the potential for improved information, ticketing and signalling technology, together with a range of bus priority measures on the A803 between the Torrance Roundabout and Colston Road junction, and improved access for pedestrians and cyclists. This will improve integration between modes and reduce reliance on private car use.	Moderate positive impact

Land-use Transport Integration	Minor positive impact through implementation of measures to improve bus journey times and journey time reliability. This could provide improved access primarily for residents from Bishopbriggs (including proposed developments such as Bishopbriggs East) commuting to / from Glasgow, and also improve public transport access to the Strathkelvin Retail Park, Westerhill and surplus Bishopbriggs Academy site, and Stobhill Hospital. Accords with SPP 2014 and EDC Local Plan 2. However, Option will enhance existing levels of service provision and will not serve any new land-use areas.	
Policy Integration	Option aligns with SPT RTS. Encourages modal shift and will assist in achieving a healthy, prosperous and inclusive society. Efficient transport connections and improving access to education and employment aligns with economic policies e.g. SPP 2014 and the Scottish Government Economic Strategy. The use of public transport (as opposed to cars) will reduce the adverse environmental impacts of traffic, particularly harmful local emissions, with an overall positive effect on health, aligning with the EDC Joint Health Improvement Plan and Climate Change Act 2008. Fits well with policies to promote social inclusion, by enabling the socially deprived (particularly those with no access to a car) access to the public transport network, and aligns with Equality Act 2010.	

## Accessibility & Social Inclusion

Sub-criterion	Item	Qualitative Information	Quantitative Information
Community Accessibility	Public Transport Network Coverage	The implementation of Quality Bus measures would improve bus journey times and journey time reliability for both local trips and also commuter trips to / from Glasgow via the A803, albeit there would be no increase in level of public transport coverage.	Neutral impact
	Access to Other Local Services	Option may promote further non-motorised trips to access local services through the provision of quality bus measures. This, together with complementary measures to improve accessibility for pedestrians and cyclists, is expected to provide minor positive benefits. There are no anticipated issues relating to severance for pedestrians or cyclists as a result of implementation of the proposed Option.	Minor positive impact

	-			
Comparative Accessibility Distribution/Spa Impacts by Soc		ution/Spatial ts by Social Group	Option would have a minor positive impact in terms of tack the problem of private car use by encouraging a modal shift towards public transport and sustainable modes of travel a improving accessibility to the public transport network. Wh this will enhance the level of accessibility for those without use of a car, existing car users will also be encouraged to leave their cars at home in favour of other modes.	t nd ilst
		ution/Spatial ts by Area	Increases accessibility to development areas e.g. Bishopbriggs Academy site, Strathkelvin Retail Park. Encourages modal shift and reduces overall reliance on the private car for local and commuter trips. Whilst the study a is generally affluent, those which are particularly dependent public transport, share in this improvement.	rea

	Bus hub in Kirkintilloch and associated measures. Bring bus stops closer together into an interchange area in the town centre,		Capital costs/grant: £216,000 (undiscounted)		
Proposal Description:	supplemented by lower cost measures such as pedestrian and cycling access improvements, more public transport information and improved shakers. The action measures and take the	Total Public Sector Funding Requirement:	Annual revenue support: N/A		
	shelters. The option may require land take. It includes the Pre-Appraisal option of repositioning bus stops in Kirkintilloch.	Present Value of Cost to Govt: £182,319			
Funding Sought From: (if applicable)	Not yet known Amount of Application: Not yet known				
Background Information					
Geographic Context:	Geographic Context: East Dunbartonshire is located to the north of the city area of Glasgow and covers an area of approximately 17,000ha. The study area for this commission is the Kirkintilloch/Lenzie-Bishopbriggs-Glasgow corridor, with key transport infrastructure within the area comprising Bishopbriggs and Lenzie rail stations, National Cycle Routes 754, the A803, A806 and Bishopbriggs Relief Road. The area is home to over 50,000 people and comprises a mix of commuter towns and villages from larger settlements such as Bishopbriggs and Kirkintilloch to smaller villages such as Milton of Campsie and Lenzotown at the foot of the Campsie Hills.				
Social Context:	The main settlements in the study area are Bishopbriggs (23,118), Kirkintilloch (20,281) and Lenzie (8,873). In terms of employment, 80.3% of East Dunbartonshire's population was economically active during 2013, with 77.2% in employment. With an average weekly wage of £594.10 (as of 2013), East Dunbartonshire is one of the most affluent communities in Scotland, with wages being significantly higher than the Scottish (£508.00) and British (£518.10) national averages. East Dunbartonshire has one of the highest car ownership rates in Scotland. As a result, car usage within the study area is high and sustainable / active travel is low. Despite being a generally affluent area, the Scottish Index of Multiple Derivation (SIMD 2012)1 shows there are certain pockets in the study corridor (particularly around Kirkintilloch) where the level of deprivation is between the 20-40% National 2012 Quintiles.				

Eco	The settlements of Bishopbriggs and Kirkintilloch are the economic centres of the study area. Each has significant levels of retail activity mainly located within their town centres. In terms of key commercial developments, the most important ones are Westerhill Business Par (home to major employers such as Aviva) and Strathkelvin Retail Park (home to a large number of retail chains). The Council's Local Plan also identifies major development proposals within the study area, which are either under construction or have consent granted and therefor have a high likelihood of being delivered. These include Woodilee (800+ units), Bishopbriggs East (250+ units) and Lennox Castle Hospita Site (350+ units).				
Pla	nning Objectives				
Obj	ective:		Performance against planning objective:		
1.	Promote modal shift to su		Minor Positive Impact (+1):		
	modes for trips to key attr study area, particularly co	ommuting journeys	A single interchange point would improve accessibility to bus services within Kirkintilloch, which in turn could have a minor positive impact in terms of promoting modal shift from car to bus.		
2.	Improve public transport j		Neutral impact (0):		
	journey time reliability thre	ough the study area.	Unlikely to have a significant impact on journey times or journey time reliability.		
3.	3. Improve accessibility by sustainable transport		Minor Positive Impact (+1):		
	modes to key trip attracto		Option would provide improved access to bus services by delivering a hub in which services arriving / departing from Kirkintilloch would meet. Associated measures such as pedestrian and cycling access improvements and information improvements would make it easier for bus users to access services.		
4.	Deliver a transport netwo		Minor Positive Impact (+1):		
	improvements to human health and air quality, while minimising the impact on the environment.		The option is assumed to have a slight positive impact on air quality overall, as a result of supporting a modal shift from car to bus. Bringing all services into one area with associated access improvements should also reduce traffic congestion in the town centre and support local air quality improvements.		
5.	Provide a sustainable trai	•	Minor Positive Impact (+1):		
	supports local development, regeneration and contributes to the sustainable economic growth of Contributes to the sustainable economic growth of Contributes to the sustainable economic growth of Kirkintilloch town centre specifically.				
	Rationale for Selection or Rejection of Proposal: Delivery of an integrated bus hub with associated facility enhancements in Kirkintilloch could increase the attractiveness of bus services in the area and support wider regeneration plans for the town.				
Imp	plementability Appraisal				
Tec		This proposal is considere the bus hub facility.	ed to be technically feasible, with no untried technologies. There may be disruption to traffic during implementation of		

Operational:	The bus shelters at the new bus hub will require to be cleaned regularly and this could be added to existing contracts at minimal additional cost to the Council, together with general maintenance of signing and lining. Real time information systems and ticketing machines, where appropriate, will require to be maintained in proper working order.					
Financial:	Option would likely be funded through a combination Government funding. It is not anticipated that funding	of local authority investment, SPT funding, local bus op g subsidies would be required.	erator funding and Scottish			
Public:	Generally considered that simpler measures such as improved shelters and facilities, real time information at bus stops and the general creation of a more pleasant waiting environment would add greater value and would be welcomed by the public. Bus operators highlighted there are already two informal bus hubs in Kirkintilloch. Some concern was expressed that delivering this Option could, in fact, add congestion to Kirkintilloch town centre. Bus operators highlighted that essentially there are already two existing informal bus hubs in Kirkintilloch town centre for buses coming from/leaving to Glasgow: Catherine Street and Townhead, respectively. Care should be taken to ensure that any Option does not encourage people to travel out of Kirkintilloch to access services elsewhere, thus having a negative impact on the economic vitality of the town centre.					
Environment						
Mitigation Options Included: (Costs & Benefits)	Mitigation approaches outlined in SEA.					
Sub-criterion	Qualitative Information         Quantitative Information         Significance of Impact					
Noise and Vibration	Any new infrastructure requirement will bring temporary (construction) noise and vibration disturbance to the town centre. Should the Option propose to develop a single centralised hub, it is likely that there will be permanent (operational) noise and vibration disturbance to receptors within the near vicinity of its location. This represents the worst-case-scenario for this Option. Other softer interventions proposed within the Option, such as access improvements, improved shelters, and greater public transport information may require some construction activities but will not result in any significant increase in noise or vibration levels.	Kirkintilloch town centre area which is utilised for residential, employment and socialising / leisure purposes will be impacted by the development of this Option. Noise and vibration disturbance from this Option is highly dependent upon the final design of the Option and the scale of the intervention(s) adopted, and any associated variances in traffic volumes within the town centre.	Minor Negative			
Global Air Quality – CO <sub>2</sub>	Given the scale of the study area and the level to which any modal shift will be achieved from the development of this Option, global air quality is not		Negligible			

	The second se		
	predicted to be significantly impacted upon.		
Local Air Quality – $PM_{10}$ and $NO_2$	The impact on air quality from the development of this Option is dependent upon the level of intervention implemented. Temporary effects will result from the construction of any new infrastructure required as part of the chosen intervention(s), however the magnitude of these effects will vary with construction effort. Should there be a modal shift to bus usage within the town centre and traffic levels reduce, air quality may improve. The softer interventions associated with this Option, such as increasing accessibility by walking and cycling and improving bus shelters are unlikely to impact air quality unless they contribute to reducing	The number of people / properties that are impacted by this Option is dependent on the intervention(s) adopted and any associated modal shift of transportation within Kirkintilloch. Assumed to have neutral impacts on air quality overall, if bus movement levels are similar to the current situation (and bus engines are becoming cleaner with new technologies and regulations). If there are impacts on traffic flow (e.g. leads to general traffic congestion in the town centre), it may increase emissions from vehicles in stop-start conditions.	Negligible – Minor Positive
Water Quality, Drainage and Flood Defence	traffic volumes within the town centre. Impacts on the water environment are dependent on the scale of the intervention(s) adopted as part of this Option, and also the location of the development in relation to the water resources within the surrounding area. Impacts will likely relate to pollutants and potential contaminants entering watercourses via surface water run-off during construction activities.	The River Kelvin and the Forth and Clyde Canal both lie within close proximity to Kirkintilloch. Although of varying water quality (bad / poor ecological potential, and good ecological potential, respectively), both water bodies are designated under the Freshwater Fish Directive for salmonid waters. Where impacts may be experienced during the construction of the intervention(s), it is predicted to be unlikely that any long-term impacts would result on the water environment, assuming any drainage systems meet regulatory requirements.	Neutral
Geology	Ground investigation/earthworks create potential for ground contamination and / or creation of pollution leakages.	There are no sensitive geological receptors within the study area; any impacts on geological resources are not likely to be significant.	Neutral
Biodiversity	Any new facilities have potential to impact on wildlife corridors. These impacts are dependent upon the location and intervention(s) adopted as part of this scheme.	Biodiversity and habitats of relevance within Kirkintilloch town centre will be limited to parks and areas of green space. There are no designated sites within Kirkintilloch.	Negligible (positive)
	Should there be a proposed new bus hub where construction effort would likely be greatest, there	Impacts on biodiversity from the development of this Option are not likely to be significant.	

Landscape & Visual Amenity Agriculture and Soils Cultural Heritage	should a singular central Any new facilities also h on the visual amenity of walking/cycling routes. The development of this urban area. Any land re development of this will land. Any new facilities have p designated cultural herit During construction and assets may be impacted through vibration, physic impacts. The magnitude of impact	Option will be within an equired to accommodate the not impact on agricultural potential to impact on age sites. operation, cultural heritage d either directly or indirectly	<ul> <li>predicted that this can be mitigated during design of the Option.</li> <li>There are Core Paths located to the south of the town centre along the Forth and Clyde Canal, as well as a long-distance path along Luggie Water.</li> <li>-</li> <li>Kirkintilloch town centre is a culturally sensitive area, bounded to the north by the Antonine Wall WHS and to the south by the Forth and Clyde Canal SAM. The centre itself is a Conservation Area and Townscape Protection Area with a high density of listed buildings including the Category A listed St Mary old parish church.</li> <li>Provided that the design of any new infrastructure is in keeping with the Conservation and Townscape Area, it is predicted that greatest impacts on cultural assets will be during construction. Sub-criterion	Item	Qualitative Information	Quantitative Information
Community Accessibility	Public Transport Network Coverage	The development of a bus hub in Kirkintilloch could assist in reducing town centre congestion through the centralisation of bus stop locations, and could improve bus journey times and journey time reliability for local trips, albeit there would be no increase in public transport coverage.	Neutral impact
	Access to Other Local Services	Option may promote further non-motorised trips to access local services through the provision of improved public transport provision. This, together with complementary measures to improve accessibility for pedestrians and cyclists, is expected to provide minor positive benefits. There are no anticipated issues relating to severance for pedestrians or cyclists as a result of implementation of this Option.	Minor positive impact

Comparative Accessibility	Distribution/Spatial Impacts by Social Group		Option could have a positive impact in terms of tackling the problem of private car use by encouraging a modal shift towards public transport and sustainable modes of travel and improving accessibility to the public transport network. Whilst this will enhance the level of accessibility for those without the use of a car, existing car users will also be encouraged to leave their cars at home in favour of other modes. In addition, households located within the small pockets of deprivation in Kirkintilloch would particularly benefit from improved access to services and employment opportunities.		Moderate positive impact	
	Distribut Impacts	ion/Spatial by Area	Encourages modal shift and reduces overall reliance on the private car for local and commuter trips. Pockets of deprivation in Kirkintilloch would benefit from increased access to services and employment opportunities.		Minor positive impact

Background Information				
Geographic Context: East Dunbartonshire is located to the north of the city area of Glasgow and covers an area of approximately 17,000ha. The study area for this commission is the Kirkintilloch/Lenzie-Bishopbriggs-Glasgow corridor, with key transport infrastructure within the area comprising Bishopbriggs and Lenzie rail stations, National Cycle Routes 754, the A803, A806 and Bishopbriggs Relief Road. The area is home to over 50,000 people and comprises a mix of commuter towns and villages from larger settlements such as Bishopbriggs and Kirkintilloch to smaller villages such as Milton of Campsie and Lennoxtown at the foot of the Campsie Hills.				
Social Context:	The main settlements in the study area are Bishopbriggs (23,118), Kirkintilloch (20,281) and Lenzie (8,873). In terms of employment, 80.3% of East Dunbartonshire's population was economically active during 2013, with 77.2% in employment. With an average weekly wage of £594.10 (as of 2013), East Dunbartonshire is one of the most affluent communities in Scotland, with wages being significantly higher than the Scottish (£508.00) and British (£518.10) national averages. East Dunbartonshire has one of the highest car ownership rates in Scotland. As a result, car usage within the study area is high and sustainable / active travel is low. Despite being a generally affluent area, the Scottish Index of Multiple Derivation (SIMD 2012)1 shows there are certain pockets in the study corridor (particularly around Kirkintilloch) where the level of deprivation is between the 20-40% National 2012 Quintiles.			

Eco	onomic Context:	The settlements of Bishopbriggs and Kirkintilloch are the economic centres of the study area. Each has significant levels of retail activity, mainly located within their town centres. In terms of key commercial developments, the most important ones are Westerhill Business Park (home to major employers such as Aviva) and Strathkelvin Retail Park (home to a large number of retail chains). The Council's Local Plan 2 also identifies major development proposals within the study area, which are either under construction or have consent granted and therefore have a high likelihood of being delivered. These include Woodilee (800+ units), Bishopbriggs East (250+ units) and Lennox Castle Hospital Site (350+ units).				
Pla	Inning Objectives					
Ob	jective:		Performance against planning objective:			
1.	<ol> <li>Improve public transport journey times and journey time reliability through the study area.</li> <li>Improve accessibility by sustainable transport modes to key trip attractors within the study area.</li> <li>Deliver a transport network that supports improvements to human health and air quality, while minimising the impact on the environment.</li> </ol>					
			Anecdotal evidence has confirmed the popularity of existing Express bus services into Glasgow and if access to a Park Ride is taken from the B757 (the current route used by the Express Services) there is the potential for these services to stop in the Park & Ride (given easy access and egress from it is provided), thus increasing the commercial viability of the site. Locating the Park & Ride adjacent to the A806 (KLR) is also an option.			
2.			Minor Positive Impact (+1): Existing links between the KLR / B757 and the M80 would effectively connect the proposed Park & Ride with the wider trunk road network supporting efficient bus journey times. Commuter services to Glasgow would likely travel along the strategic road network; improvements to which are outwith the scope of this study.			
3.			<i>Neutral / No impact (0):</i> Option would have a negligible impact against this objective; it is anticipated that access to the Park & Ride site would primarily be taken by private car.			
4.			Neutral / No impact (0): Although this option seeks to promote increased bus usage, the development of a Park & Ride facility would likely generate a large number of additional local private vehicle trips associated with local residents accessing the site.			
5.		port network that supports local and contributes to the sustainable	Minor Positive Impact (+1): Implementation of a Park & Ride along the KLR or B757 would open up opportunities to connect the			

economic growth of the st	of employment. Ho Park & Ride site of	study area with the strategic road network, which in turn would facilitate travelling to and from major areas of employment. However, depending on the location of any future possible facility, there is a risk that a Park & Ride site outwith the town centre could have a negative economic impact on the local town associated with a displacement of trips from the town centre to an out of centre Park & Ride location.					
Rationale for Selection or Rejection of Proposal: A bus-based Park & Ride facility located along the KLR or B757 aimed at promoting a modal shift for commuting journeys between there may be some negative environmental impacts associated with land take and the generation of local traffic to access the Park &							
Implementability Appraisal							
Technical:	This proposal is considered to be technically feasib of the Park & Ride facility.	le, with no untried technologies. There may be disrup	tion to traffic during construction				
Operational:	This proposal will require public transport patronage levels to at least be sustained in order to be commercially viable and operate successfully over its projected life. Should additional buses be required to service the Park & Ride facility, there will be associated operational costs. Whilst assumptions have been made in relation to the frequency of bus service provision for the purposes of deriving operational costs, ultimately the level of service will be dictated by commercial viability. Future implementation of hard-shoulder running on the M80 (currently being considered by Transport Scotland) could enhance the deliverability of this Option through providing improved journey times and journey time reliability during periods of high traffic volumes.						
Financial:	Scottish Government funding. There is also potenti	Option would be likely be funded through a combination of local authority investment, SPT funding, local bus operator funding and Scottish Government funding. There is also potential for developer contributions. The bus services may require an ongoing level of subsidy to sustain their operation. Further detailed work on the specification of the services would be required to ascertain the level of subsided.					
Public:	bodies). Localised objections to Park & Ride exped	No significant public acceptability issues expected. Option generally felt to be attractive (particularly by bus operators and transport bodies). Localised objections to Park & Ride expected depending on site selection. If modal shift was achieved, it was anticipated that this Option would help to mitigate rail overcrowding issues, thereby being publically acceptable.					
Environment							
Mitigation Options Included: (Costs & Benefits)	Mitigation approaches outlined in SEA.						
Sub-criterion	Qualitative Information	Quantitative Information	Significance of Impact				
Noise and Vibration	Noise impacts for residential areas from more cars and any additional bus services. However, proposed route is already accessed by cars and buses as a main local road accessing the strategic trunk road network. Significant new infrastructure is likely to introduce new noise sources that may pass close to	There are two preliminary locations identified for the Park & Ride scheme – adjacent to the Kirkintilloch Link Road (KLR) or adjacent to the B757. Of the two locations it is likely that a greater number of receptors will be impacted from development of a Park & Ride scheme adjacent to the KLR. The significance of effect is dependent on the detailed alignments, elevations, topography	Moderate Negative				

	residential areas and through locations that are not currently subject to significant noise impacts (although impact depends on ambient noise levels and level of vehicle movements already occurring). Noise levels will depend on the detailed alignments, elevations, topography and the proximity and sensitivity of noise sensitive receptors. New Park & Ride facility may increase noise impacts due to road traffic flows increasing in these areas.	and any potential mitigation measures included within detailed design and construction practices. It is anticipated that the majority of noise effects may be mitigated for, during construction and incorporating noise barriers in to the final design of the scheme. Permanent impacts from noise and vibration from the development of a Park & Ride scheme are not likely to be significant. Noise sensitive receptors and the magnitude of the effects are dependent on the final location of the Park & Ride facility and volumes of traffic generated.	
Global Air Quality – CO <sub>2</sub>	Given the scale of the study area and the level to which any modal shift will be achieved from the development of this Option, global air quality is not predicted to be significantly impacted upon.		Negligible
Local Air Quality – $PM_{10}$ and $NO_2$	Currently there is no existing formal Park & Ride provision. Overall contribution to improvement in air quality as promoting more sustainable modes of transport, provided Park & Ride does not abstract users from rail or other bus services, which it potentially may. There are likely to be negative effects on air quality from the construction of the Park & Ride facility and associated infrastructure and access requirements	Effects could be experienced across the study area due to potential changes in traffic distribution, however overall these effects are likely to be negligible. Long-term effects will likely occur as a result in a minor improvement in local air quality through the promotion of more sustainable modes of transport.	Minor Positive
Water Quality, Drainage and Flood Defence	Impacts on the water environment are dependent on the location and scale of the Park & Ride scheme. Impacts will likely relate to pollutants and potential contaminants entering watercourses via surface water run-off during construction activities. Fuels and oils leaked from parked cars during operation may also enter water bodies, reducing water quality. Hardstanding areas may increase flood risk to surrounding areas from reducing infiltration rates and increasing runoff rates.	Based on the potential outline locations, temporary effects could impact either Bothlin Burn (KLR site) or Gadloch (B757 site). Development of a Park & Ride scheme at a site adjacent to the KLR may result in increased flood risk of the Bothlin Burn due to increased run-off from hardstanding areas and reduced holding capacity within the catchment. Impacts on the water environment are dependent upon the final location of the Park & Ride scheme.	Minor Negative

Geology	Ground investigation/earthworks create potential for ground contamination, creation of pollution leakages.	There are no sensitive geological receptors within the study area and any impacts on geological resources are not likely to be significant.	Minor Negative
Biodiversity To develop the Park & Ride scheme at either location would likely result in land-take from undeveloped areas of some habitat for protected species such as bats and badgers may be lost or disturbed.		The wooded area at the site adjacent to the KLR is also adjacent to a pocket of Ancient woodland listed within the AWI, which may be directly or indirectly impacted upon as a result of the construction and/or operation of a Park & Ride scheme in this location. Impacts are dependent on the final location and design of the Park & Ride scheme.	Minor Negative
Landscape and Visual Amenity	The introduction of a new facility has the potential to result in adverse effects on the landscape and visual amenity of the area. There is also the likely requirement to light the development for health and safety and security purposes. Lighting / light spillage may also impact surrounding receptors. The likelihood of impacts on landscape and visual amenity will increase should natural screening such as established planting be removed.	Of the potential sites, a site adjacent to the KLR is within/ immediately adjacent to the south Lenzie Conservation Area and Townscape Area. This is also surrounded by residential areas and a long- distance pathway and Core Path along the Bothlin Burn. Depending on the scale, location and design of Park & Ride at this location there may be significant adverse effects. A site on the B757 south of Lenzie would be located within close proximity to the south Lenzie Conservation Area and Townscape Area, however is located in an area adjacent to fields and Lenzie Golf Course. Depending on the scale, design and final location of a Park & Ride in this area, there may be significant adverse effects on visual amenity due to the development breaking existing landscape.	Moderate Negative
Agriculture and Soils Agriculture and Soils Agriculture and Soils Soils are also likely to be impacted where excavation is required, and/or earthworks for site		Of the potential locations, a site adjacent to the B757 would likely require land take. The extent of this area is dependent upon the final location and the scale of the Park & Ride scheme. The agricultural land surrounding this area is regarded as being of Class 3.2 – capable of supporting 'mixed agriculture'.	Minor Negative

Cultural Heritage Monetised summary	Cultural heritage sites may be directly impacted from physical damage due to construction activities and / or vibration, or indirectly from impacts on their setting depending on the location, scale and design of the intervention. There is the potential that there are unknown archaeological assets located at the proposed Park & Ride locations. Not determined		A location adjacent to the KLR is within the Lenzie Conservation Area, and immediately adjacent to an area of woodland within the Ancient Woodland Inventory. The site adjacent to the B757 is on the edge of the south Lenzie Conservation Area. Impacts on these receptors are dependent upon the final design and scale of the Park & Ride scheme.		Minor Negative	
Monetary Impact Ratio	Not determined

Economy (Economic Activity and Location Impacts)				

Sub-criterion	Item	Qualit	tative Information	Quantitative Information
Economic Activity and Location Impacts	Local Economic Impacts	This Option will help to support local economic development opportunities on the Kirkintilloch / Lenzie – Bishopbriggs – Glasgow corridor through a combination of managed congestion brought about by increased accessibility, and improved journey times particularly along the A803 corridor through the transfer of trips from this corridor to a P&R site in the vicinity of the KLR or B757. In addition, this Option may have wider economic impacts through improving public transport and accessibility to Glasgow.		N/A
	National Economic Impacts	There could be expected to be small employment gains in the wider study area including Glasgow, Bishopbriggs, Lenzie and Kirkintilloch. The Option will act as a fundamental 'building block' in the continuing competitiveness of East Dunbartonshire, and Glasgow, as strategic investment locations.		N/A
	Distributional Impacts	The proposal will contribute at the National level to improving labour market flexibility and movement, and thus availability, particularly within Glasgow, Bishopbriggs, Lenzie and the Kirkintilloch area.		N/A
Integration				
Sub-criterion	Item		Qualitative Information	Quantitative Information
Transport Interchanges	Transport Interchanges		Option would encourage transfer of trips from cars to bus services for journeys to and from Glasgow. However, this may be negated by an increase in more local car trips to the Park & Ride facility and this would require to be considered appropriately at the design stage. The facility would be used by existing bus services and no new services are proposed.	Moderate positive impact
	Infrastructure and Information		ucture and Information The Park & Ride site would be designed with consideration given to quality of infrastructure, layout and information provision.	
Land-use Transport Integration		Moderate positive impact on land-use integration though the construction of bus-based Park & Ride facility aimed at promoting a modal shift for commuting journeys between the study area and Glasgow, and providing access to a variety of land uses in the wider area including shopping, employment and transport. It is expected that the Park & Ride facility would integrate with residential properties located to the east of the	Moderate positive impact	

Sub-criterion	Item	Qualitative Information	Quantitative Information
Accessibility and Social Inclusion	on		
Policy Integration		Option aligns with SPT RTS. Encourages modal shift and will assist in achieving a healthy, prosperous and inclusive society. Efficient transport connections and improving access to education and employment aligns with economic policies e.g. SPP 2014 and the Scottish Government Economic Strategy. The use of public transport (as opposed to cars) will reduce the adverse environmental impacts of traffic, particularly harmful local emissions, with an overall positive effect on health, aligning with the EDC Joint Health Improvement Plan and Climate Change Act 2008. Fits well with policies to promote social inclusion, by enabling the socially deprived (particularly those with no access to a car) access to the public transport network, and aligns with Equality Act 2010.	Moderate positive impact
		KLR, and would support wider regeneration plans for the town. Accords with SPP 2014, the EDC Local Plan 2 and the Kirkintilloch Masterplan.	

Sub-criterion	item		
Community Accessibility Public Transport Network Coverage		The implementation of bus-based Park & Ride would increase the attractiveness of bus as a mode of transport for commuting trips to / from Glasgow and would potentially remove pressure from the rail network and assist in alleviating Lenzie Rail Station parking difficulties.	Minor positive impact
	Access to Other Local Services	Option may promote non-motorised access to local services through the provision of a Park & Ride facility. No anticipated issues relating to severance for pedestrians or cyclists as a result of implementation of the Option. The new facility should include for cycle provision and consideration to access routes for pedestrians and cyclists will form a key element.	Minor positive impact
Comparative Accessibility	Distribution/Spatial Impacts by Social Group	Option would have a minor positive impact in terms of tackling the problem of private car use by encouraging a modal shift towards public transport and sustainable modes of travel and improving accessibility to the public transport network. Whilst this will enhance the level of accessibility for those without the use of a car, existing car users will also be encouraged to leave their cars at home in favour of other modes.	Minor positive impact

	Distribution/Spatial Impacts by Area	Increases accessibility to development areas e.g. Woodilee and Kirkintilloch Masterplan area. Encourages modal shift and reduces overall reliance on the private car for commuter trips to / from Glasgow.

	This Option involves the development of a 200		Capital costs/grant (undiscounted): £1,267,200					
Proposal Description:	This Option involves the development of a 300 space, bus-based Park & Ride adjacent to the Bishopbriggs Relief Road (at a location to be	Total Public Sector Funding Requirement:	Annual revenue support: £80k p/a + bus running and replacement costs					
	defined). The Option assumes the service would be served by a dedicated new service.		Present Value of Cost to Govt: £2,363,000 - £10,084,000 <sup>1</sup>					
Funding Sought From: (if applicable)	Not yet known	Amount of Application:	Not yet known					
Background Information								
Geographic Context:	East Dunbartonshire is located to the north of the city area of Glasgow and covers an area of approximately 17,000ha. The study area for this commission is the Kirkintilloch/Lenzie-Bishopbriggs-Glasgow corridor, with key transport infrastructure within the area comprising Bishopbriggs and Lenzie rail stations, National Cycle Routes 754, the A803, A806 and Bishopbriggs Relief Road. The area is home to over 50,000 people and comprises a mix of commuter towns and villages from larger settlements such as Bishopbriggs and Kirkintilloch to smaller villages such as Milton of Campsie and Lennoxtown at the foot of the Campsie Hills.							
Social Context:	The main settlements in the study area are Bishopbriggs (23,118), Kirkintilloch (20,281) and Lenzie (8,873). In terms of employment, 80.3% of East Dunbartonshire's population was economically active during 2013, with 77.2% in employment. With an average weekly wage of £594.10 (as of 2013), East Dunbartonshire is one of the most affluent communities in Scotland, with wages being significantly higher than the Scottish (£508.00) and British (£518.10) national averages. East Dunbartonshire has one of the highest car ownership rates in Scotland. As a result, car usage within the study area is high and sustainable / active travel is low. Despite being a generally affluent area, the Scottish Index of Multiple Derivation (SIMD 2012)1 shows there are certain pockets in the study corridor (particularly around Kirkintilloch) where the level of deprivation is between the 20-40% National 2012 Quintiles.							

<sup>&</sup>lt;sup>1</sup> Lower PVC reflects assumption that Park & Ride would be served by existing bus services, whereas higher PVC reflects the additional operating costs that are assumed with delivery of a Park & Ride served by new bus services.

Ecc	pnomic Context:	The settlements of Bishopbriggs and Kirkintilloch are the economic centres of the study area. Each has significant levels of retail activity, mainly located within their town centres. In terms of key commercial developments, the most important ones are Westerhill Business Park (home to major employers such as Aviva) and Strathkelvin Retail Park (home to a large number of retail chains). The Council's Local Plan 2 also identifies major development proposals within the study area, which are either under construction or have consent granted and therefore have a high likelihood of being delivered. These include Woodilee (800+ units), Bishopbriggs East (250+ units) and Lennox Castle Hospital Site (350+ units).				
Pla	nning Objectives					
Obj	jective:		Performance against planning objective:			
1.		ainable transport modes for trips to	Moderate Positive Impact (+2):			
			The development of a Park & Ride facility adjacent to the BRR would ensure quick access for commuter journeys onto the strategic trunk road network, which in turn would be expected to support modal shift from private car use to bus, particularly for commuters.			
2.	Improve public transport jou	urney times and journey time	Minor Positive Impact (+1):			
			Existing and future links between the BRR and the M80 would effectively connect the Park & Ride with the wider trunk road network, and provide efficient bus journey times. The opportunity to develop express commuter service bus would also be enhanced through the provision of a Park & Ride facility linked up with the BRR in this location.			
3.	Improve accessibility by sus	stainable transport modes to key trip	Minor Positive Impact (+1):			
	attractors within the study area.		It is considered that development of a Park & Ride in this location would increase the number of journeys made to Westerhill Business Park by bus, reducing the number of private car trips. This business park is promoted by the Council for economic use and development. There may however be some minor negative impacts locally through the generation of local traffic to access the Park & Ride.			
4.	Deliver a transport network	that supports improvements to	Neutral / No impact (0):			
	human health and air quality, while minimising the impact on the environment.		This Option seeks to promote increased bus usage, which in turn should have a positive impact in terms of human health and air quality as a result of reduced emissions achieved by modal shift from car to bus.			
5.	development, regeneration and contributes to the sustainable economic growth of the study area.		Minor Beneficial Impacts (+1):			
			Implementation of a Park & Ride along the BRR would open up opportunities to connect the study area with the strategic road network, which in turn would facilitate travelling to and from major areas of employment. The site would also increase the attractiveness of Westerhill for future development, therefore having a positive impact on the local economy.			

Rationale for Selection or Rejection of Proposal:	This intervention would be anticipated to support improved bus journey times and in turn increase public transport accessibility and encourage modal shift for commuter journeys, including journeys to the study area by improving sustainable access to Westerhill Business Park. There could be some negative impacts locally associated with land take and the generation of local traffic to access the Park & Ride, however positive economic impacts would be anticipated associated with increasing the accessibility of Westerhill Business Park.						
Implementability Appraisal							
Technical:	This proposal is considered to be technically feas of the Park & Ride facility.	sible, with no untried technologies. There may be disrug	ption to traffic during construction				
Operational:	This proposal will require public transport patronage levels to be at least be sustained in order to be commercially viable and operate successfully over its projected life. There would be additional operational costs associated with additional buses required to service the Park & Ride facility. Whilst assumptions have been made in relation to the frequency of bus service provision for the purposes of deriving operational costs, ultimately the level of service will be dictated by commercial viability. Future implementation of hard-shoulder running on the M80 (currently being considered by Transport Scotland) could enhance the deliverability of this Option by providing improved journey times and journey time reliability during periods of high traffic volumes.						
Financial:	Option would likely be funded through a combination of local authority investment, SPT funding, local bus operator funding and Scottish Government funding. There is also potential for developer contributions. Bus services may require an ongoing level of subsidy to sustain their operation. Further detailed work on the specification of the services would be required to ascertain the level of support needed.						
Public:	No significant public acceptability issues expected. Localised objections to Park & Ride expected depending on site selection. This Option could be a driver of economic development at Westerhill and may attract other businesses into the area, which would gain public support. Considered that this Option may ease congestion through the A803 as it may attract residents from more remote communities (i.e. Lennoxton, Torrance, Milton of Campsie) who are travelling into Glasgow. The transfer of trips from car to bus would help reduce congestion on the A803 which could increase accessibility through Bishopbriggs town centre, reduce parking problems and increase access to locations such as Stobhill Hospital, all of which are publically acceptable.						
Environment							
Mitigation Options Included: (Costs & Benefits)	Mitigation approaches outlined in SEA.						
Sub-criterion	Qualitative Information         Quantitative Information         Significance of Impact						
Noise and Vibration	Noise impacts for residential areas from more cars and additional bus services. However, less traffic on side roads and less noise as result. Significant new infrastructure is likely to introduce new noise sources that may pass close to residential areas and through locations that are not currently subject to significant noise impacts (although impact depends on ambient	The development of a Park & Ride scheme would draw volumes of traffic to the immediate east of Westerhill Business Park and nearby residential areas, however this is also adjacent to the BRR which will increase noise in the area regardless of the Park & Ride scheme. The Park & Ride should ultimately result in reduced traffic levels, however this reduction will not be significant. Noise sensitive receptors and the magnitude of the effects are	Minor Negative				

	noise levels and level of vehicle movements already occurring). New Park & Ride facility may increase noise impacts due to road traffic flows increasing in these areas. However, noise mitigation including barriers may be required in certain sections, which would lessen any impacts. There are currently trees screening the residential area from the proposed Park & Ride site.	dependent on the final location of the Park & Ride facility. Permanent noise emitted from the Park & Ride will depend on the detailed alignments, elevations, topography and mitigation measures incorporated during construction and included within the detailed design.	
Global Air Quality – CO <sub>2</sub>	Given the scale of the study area and the level to which any modal shift will be achieved from the development of this Option, global air quality is not predicted to be significantly impacted upon.		Negligible
Local Air Quality – $PM_{10}$ and $NO_2$	Overall contribution to improvement in air quality as promoting more sustainable modes of transport, provided the Park & Ride does not abstract users from rail or longer-distance bus services.	There are likely to be negative effects on air quality from the construction of a Park & Ride scheme. The overall significance of these impacts is dependent upon the scale of the scheme and the mitigation measures that can be put in place to reduce or avoid these effects. Long-term effects will likely occur as a result in a minor improvement in local air quality through the promotion of more sustainable modes of transport.	Minor Positive
Water Quality, Drainage and Flood Defence	Impacts on the water environment are dependent on the location and scale of the Park & Ride scheme. Impacts will likely relate to pollutants and potential contaminants entering watercourses via surface water runoff during construction activities. Fuels and oils leaked from parked cars during operation may also enter water bodies, reducing water quality. Hardstanding areas may increase flood risk to surrounding areas from reducing infiltration rates and increasing run-off rates.	Water resources within the surrounding area of the proposed Park & Ride scheme are limited to small field drains and areas of surface water as a result of poor drainage. Although these water bodies may be part of the wider River Kelvin catchment, temporary effects during construction are not predicted to be significant. The area to the south of the railway track is noted as being at risk to surface water flooding. The development of hardstanding area within the near vicinity may either displace or contribute to this area of flood risk. If so, a detailed flood risk assessment would be required. These impacts can be mitigated within the design of the scheme.	Negligible
Geology	Ground investigation / earthworks create potential for ground contamination and / or	There are no sensitive geological receptors within the study area; any impacts on geological resources	Minor Negative

	creation of pollution leakages.	are not likely to be significant.	
Biodiversity	To develop a Park & Ride scheme there is likely to be land take from areas of habitat value and probable tree removal. Subsequently, habitat for protected species such as bats and badgers	The area proposed for the development of this Option is currently used for agricultural purposes or woodland immediately adjacent to the north and south sides of the rail track. The railway line is identified as an important ecological corridor by East Dunbartonshire Council. The magnitude of effect on these areas is subject to the design of the scheme and the land-take required to accommodate the footprint of the Park & Ride scheme and associated access routes.	Minor Negative
	may be lost or disturbed.	The woodland habitat and surrounding fields provide good foraging and potential roosting habitat for bats, and potentially other protected species such as badgers. Breeding birds may also be impacted should works be undertaken within the breeding season.	
Landscape & Visual Amenity	Potential for minor adverse visual impact as introducing a feature into the landscape. It is likely that this will also require lighting for health and safety and security purposes. Receptors in the area may also be impacted by lighting / light spillage.	Development of a Park & Ride scheme at this location could result in the loss of agricultural land, and potentially some woodland areas. There may be effects on visual amenity however these are dependent on the location and design of the scheme. Given the development of Westerhill Business Park and the BRR to the west of this location, the Park & Ride would be mostly in keeping with the surrounding area.	Minor Negative
		It is predicted that other potentially adverse views of the development could be screened.	
	Impacts on agriculture are likely to occur should new infrastructure result in the loss or severance	This Option is proposed in an area that is predominantly utilised for agricultural purposes. This land is regarded as being of Class 3.2 – capable of supporting 'mixed agriculture'.	
Agriculture and Soils	of agricultural land. Soils are also likely to be impacted where excavation is required, and/or earthworks for site establishment.	It is likely that land take from current agricultural use would be required in order to accommodate the Park & Ride scheme and its associated infrastructure. The extent of this area and therefore the magnitude of impact are dependent upon the final location and the scale of the Park & Ride scheme.	Minor Negative
Cultural Heritage	Cultural heritage sites may be directly impacted from physical damage due to construction	The only known cultural heritage asset within the near vicinity of the proposed site is the Category C	Minor Negative

Social Context:	The main settlements in the study area are Bishopbriggs (23,118), Kirkintilloch (20,281) and Lenzie (8,873). In terms of employment, 80.3% of East Dunbartonshire's population was economically active during 2013, with 77.2% in employment. With an average weekly wage of £594.10 (as of 2013), East Dunbartonshire is one of the most affluent communities in Scotland, with wages being significantly higher than the Scottish (£508.00) and British (£518.10) national averages. East Dunbartonshire has one of the highest car ownership rates in Scotland. As a result, car usage within the study area is high and sustainable / active travel is low. Despite being a generally affluent area, the Scottish Index of Multiple Derivation (SIMD 2012)1 shows there are certain pockets in the study corridor (particularly around Kirkintilloch) where the level of deprivation is between the 20-40% National 2012 Quintiles.				
Economic Context:	The settlements of Bishopbriggs and Kirkintilloch are the economic centres of the study area. Each has significant levels of retail activity, mainly located within their town centres. In terms of key commercial developments, the most important ones are Westerhill Business Park (home to major employers such as Aviva) and Strathkelvin Retail Park (home to a large number of retail chains). The Council's Local Plan 2 also identifies major development proposals within the study area, which are either under construction or have consent granted and therefore have a high likelihood of being delivered. These include Woodilee (800+ units), Bishopbriggs East (250+ units) and Lennox Castle Hospital Site (350+ units).				

Planning Objectives	Planning Objectives				
Objective:		Performance against planning objective:			
<ol> <li>Promote modal shift to sustainable transport modes for trips to key attractors outside of the study area, particularly commuting journeys.</li> </ol>		Minor Positive Impact (+1): Overall, this option is primarily focused on local service improvements within the study area and would therefore not be expected to have a major impact in terms of promoting a modal shift for commuter journeys. However, the option could improve sustainable access to Lenzie rail station, and deliver improvements to the general perception of public transport within the study area, which in turn could have a positive impact in terms of promoting modal shift for commuter trips.			
<ol> <li>Improve public transport journey times and journey time reliability through the study area.</li> </ol>		Neutral / No impact (0): If this option is successful in promoting increased active travel and a corresponding decrease in private car use, there is the potential for this option to support modal shift, which would bring bus journey time and reliability improvements. However, no specific bus priority measures are proposed.			
3. Improve accessibility by sustainable transport modes to key trip attractors within the study area.		Moderate Positive Impact (+2): This option is expected to deliver improvements in local accessibility in the Lenzie/Kirkintilloch area by connecting key locations via a new loop bus service. Option involves providing services to areas currently not serviced by public transport.			
<ol> <li>Deliver a transport ne supports improveme health and air quality the impact on the en</li> </ol>	nts to human v, while minimising	Minor Positive Impact (+1): Option seeks to promote increased public transport patronage, which should contribute to modal shift from private car to bus, in turn having a positive effect on human health and local air quality.			
<ol> <li>Provide a sustainable transport network that supports local development, regeneration and contributes to the sustainable economic growth of the study area.</li> </ol>		<i>Minor Positive Impact (+1):</i> By linking key locations within the study area (particularly around Lenzie and Kirkintilloch), this option is anticipated to support local development and promote local economic growth and access to residential, employment and retail sites.			
Rationale for Selection of Proposal: This option is designed to improve access to key trip attractors within the study area by public transport, and will benefit the local population in particular with some potential modal shift impacts, albeit this is not expected to be significant. By linking key locations within the study area (particularly around Lenzie and Kirkintilloch), this option has potential to support local development and promote local economic growth and access residential, employment and retail sites.					
Implementability Appra	Implementability Appraisal				
Technical:	This proposal is co	onsidered to be technically feasible, with no untried technologies.			

Operational:	This proposal will require a minimum level of patronage to at least be sustained in order to be commercially viable and operate successfully over its projected life. There will be operational costs associated with buses required for the loop bus. Whilst assumptions have been made in relation to the frequency of bus service provision for the purposes of deriving operational costs, ultimately the level of service will be dictated by commercial viability and required level of subsidy.					
Financial:	Option would likely be funded through a combination of local potential for developer contributions, and possibly an element buses required to operate the loop bus service. Issues relating further with bus operators and SPT. The bus service is likely the specification of the service would be required to ascertain	t of funding from local businesses. There will be operation to the commercial viability and funding of this Option w to require an ongoing level of subsidy to sustain its operation	nal costs associated with ould require to be discussed			
Public:	Consultation confirmed support for more local bus services, particularly linking key destinations to Lenzie Rail Station. This could address current parking problems at the Station, albeit it was noted that existing buses do already link directly (or with one change) to Lenzie Station but people continue to drive, so it was felt unlikely that this behaviour would change significantly by implementing this Option. It was suggested that the loop bus could help improve access to local amenities, and provision of such a service, coupled with existing parking issues in the area, may achieve a degree of modal shift from car which would be publically acceptable. Concerns have however been expressed around the commercial viability and funding for a loop bus service.					
Environment						
Mitigation Options Included: (Costs & Benefits)						
Sub-criterion	Qualitative Information	Quantitative Information	Significance of Impact			
Noise and Vibration	As there are no construction activities associated with this Option there will be no adverse noise or vibration impacts from constructing new infrastructure.	There is minimal modal shift anticipated as a result of the implementation of this scheme, therefore there are unlikely to be any long-term effects (beneficial or negative) from noise and/or vibration effects	Neutral			
Global Air Quality – CO <sub>2</sub>	Given the scale of the study area and the level to which any modal shift will be achieved from the development of this Option, global air quality is not predicted to be significantly impacted upon.					
Local Air Quality – $PM_{10}$ and $NO_2$	The development of this Option is not likely to result in any effects on air quality.	There is not predicted to be a significant modal shift to more sustainable transport, however should people be encouraged to use buses more regularly local air quality may improve from reduced emissions. These effects are likely to be negligible.	Neutral			
Water Quality, Drainage and Flood Defence	Changes to service patterns on existing routes are unlikely to have significant impacts on the water environment.					
Geology	This Option is not predicted to result in any geological

Economy (Economic	Activity and Location	on Impacts)			
Sub-criterion	ltem	Qualitative I	nformation	Quantitative Information	
Economic Activity and Location Impacts	Local Economic Impacts	between Len bus service o	n may have local economic impacts through improving public transport access enzie and Kirkintilloch, however this may be negated if the implementation of a loop e opens up the local economy of Kirkintilloch to more competition through improving the rail network and associated wider economic centres.		N/A
	National Economic Impacts	Option is prin	narily a local intervention.		N/A

	Distributional Impacts	The proposal will have negligible impact at the National level in terms of improving labour market flexibility, movement, and thus availability. It is anticipated that the small pockets of deprivation in Hillhead and, to a lesser degree, Lennoxtown, will seek to benefit from the transport improvements associated with this Option, primarily by virtue of increased accessibility to job and labour market opportunities being created within and outside the study area.	N/A
Integration			
Sub-criterion	ltem	Qualitative Information	Quantitative Information
Transport Interchanges	Services & Ticketing	Potential new loop bus service would link key locations such as Lenzie Rail Station, Kirkintilloch town centre, Woodilee, residential areas and the Council main offices, and would be timetabled to dovetail with rail services at Lenzie Rail Station, thus improving integration between bus and rail modes. This Option includes the potential for integrated bus-rail ticketing.	Moderate positive impact
	Infrastructure & Information	The loop bus service would be designed with consideration given to quality of waiting facilities and information provision.	Moderate positive impact
Land-use Transport Integration		This Option is expected to have a moderate positive impact on land-use integration through linking Lenzie rail station to a variety of land uses in the local area including shopping, housing, education, employment and transport. It accords with SPP 2014, the EDC Local Plan 2.	Moderate positive impact
Policy Integration		Option aligns with SPT RTS. Encourages modal shift and will assist in achieving a healthy, prosperous and inclusive society. Efficient transport connections and improving access to education and employment aligns with economic policies e.g. SPP 2014 and the Scottish Government Economic Strategy. The use of public transport (as opposed to cars) will reduce the adverse environmental impacts of traffic, particularly harmful local emissions, with an overall positive effect on health, aligning with the EDC Joint Health Improvement Plan and Climate Change Act 2008. Fits well with policies to promote social inclusion, by enabling the socially deprived (particularly those with no access to a car) access to the public transport network, and aligns with Equality Act 2010.	Moderate positive impact
Accessibility & Soci	al Inclusion		
Sub-criterion	Item	Qualitative Information	Quantitative Information
Community Accessibility	Public Transport Network Coverage	The introduction of a Kirkintilloch / Lenzie loop bus service would increase public transport network coverage and improve access to Lenzie rail station, thereby increasing the number of people able to access local and city centre employment opportunities. Would also assist in improving access to employment opportunities within Kirkintilloch town centre, both for those who would make the journey entirely by bus and those who would interchange with rail services at Lenzie. Also offers increase in sustainable access to key services and facilities.	Moderate positive impact
	Access to Other Local Services	The bus improvements associated with the loop service will be of benefit in improving access to local services, particularly within Kirkintilloch and providing linkages to Lenzie. This is particularly important in terms of tackling social exclusion and providing sustainable transport access to key services, facilities and employment for those without direct access to a rail station.	Moderate positive impact

Comparative Accessibility Distribution/Spatia Impacts by Social Group		cts by Social	Option would have a positive impact in terms of tackling the problem of private car use by encouraging a modal shift towards public transport and sustainable modes of travel and improving accessibility to the public transport network. Whilst this will enhance the level of accessibility for those without the use of a car, existing car users will also be encouraged to leave their cars at home in favour of other modes. Households located within the small pockets of deprivation in Kirkintilloch would particularly benefit from improved access to services and employment opportunities.		Moderate positive impact	
		ibution/Spatial cts by Area	Increases accessibility to development areas e.g. Wo and key destinations e.g. Lenzie rail station. Encourage reliance on the private car for local and commuter trip would benefit from increased access to services and	Moderate positive impact

Background Information						
Geographic Context:	commission is the Kirkintilloch/Lenzie-Bishopbrig Bishopbriggs and Lenzie rail stations, National Cyc 50,000 people and comprises a mix of commuter to	East Dunbartonshire is located to the north of the city area of Glasgow and covers an area of approximately 17,000ha. The study area for this commission is the Kirkintilloch/Lenzie-Bishopbriggs-Glasgow corridor, with key transport infrastructure within the area comprising Bishopbriggs and Lenzie rail stations, National Cycle Routes 754, the A803, A806 and Bishopbriggs Relief Road. The area is home to over 50,000 people and comprises a mix of commuter towns and villages from larger settlements such as Bishopbriggs and Kirkintilloch to smaller villages such as Milton of Campsie and Lennoxtown at the foot of the Campsie Hills.				
Social Context:	The main settlements in the study area are Bishopbriggs (23,118), Kirkintilloch (20,281) and Lenzie (8,873). In terms of employment, 80.3% of East Dunbartonshire's population was economically active during 2013, with 77.2% in employment. With an average weekly wage of £594.10 (as of 2013), East Dunbartonshire is one of the most affluent communities in Scotland, with wages being significantly higher than the Scottish (£508.00) and British (£518.10) national averages. East Dunbartonshire has one of the highest car ownership rates in Scotland. As a result, car usage within the study area is high and sustainable / active travel is low. Despite being a generally affluent area, the Scottish Index of Multiple Derivation (SIMD 2012)1 shows there are certain pockets in the study corridor (particularly around Kirkintilloch) where the level of deprivation is between the 20-40% National 2012 Quintiles.					
Economic Context:	mainly located within their town centres. In terms of key commercial developments, the most important ones are Westerhill Business Park (home to major employers such as Aviva) and Strathkelvin Retail Park (home to a large number of retail chains). The Council's Local Plan 2 also identifies major development proposals within the study area, which are either under construction or have consent granted and therefore have a high likelihood of being delivered. These include Woodilee (800+ units), Bishopbriggs East (250+ units) and Lennox Castle Hospital				

Planning Objectives	
Objective:	Performance against planning objective:
•	Minor Positive Impact (+1):
particularly commuting journeys.	This option is likely to attract more users to Lenzie station as a result of easier access for car users (who would be able to park their car in the additional parking spaces provided). This would result in an increase in the number of commuting trips made by sustainable transport (in this case, rail). However, it could also include abstraction from existing bus and rail routes e.g. rail journeys already made from Croy.
2. Improve public transport journey times and journey time	Neutral / No impact (0):
	If the option is successful in promoting increased rail travel and a corresponding decrease in private car use, there is the potential for this option to support the re-allocation of road space to public transport, which would bring journey time and reliability improvements. However, this is likely to be balanced by an increase in the number of local car trips (i.e. trips to get to the proposed car park). Therefore, overall effect would be neutral.
3. Improve accessibility by sustainable transport modes to	Minor Negative Impact (-1):
	Neutral effect on accessibility within the study area, as it is unlikely that car park users would use the train to travel within the study area (i.e. between Bishopbriggs and Lenzie). This option is also promoting car use to a key trip attractor (a rail station) and therefore performs negatively against this TPO.
4. Deliver a transport network that supports improvements	Moderate Negative Impact (-2):
impact on the environment.	This option is anticipated to have a negative environmental impact. The first sub-option (extending the car park to the north) would affect the route of an existing Core Path, involve clearance of mature trees and impact upon an adjacent Conservation Area. The other sub-option (creating a new car deck) would have a significant visual impact on the area surrounding the station. As this option would encourage more car trips to the station, this would have a negative local impact in terms of noise and air quality.
1 11	Minor Positive Impact (+1):
sustainable economic growth of the study area.	Option is likely to increase the attractiveness of Lenzie station, which could open up opportunities for increased rail travel and support local development of the area, although any wider economic impacts is likely to be minimal.
Rationale for Selection or increased parking provision a	tunity for rail travel from Lenzie, which could result in a corresponding decrease in private car use. However, tt Lenzie Rail Station may generate more local traffic in populated areas, with associated negative impacts on lso result in negative environmental impacts.
Implementability Appraisal	

Technical:	This proposal is considered to be technically feasible, with no untried technologies. There may be disruption to traffic during construction of the extended car park facility. Construction of a raised car park adjacent to or over a live railway is technically challenging.					
Operational:	This proposal is considered to be operationally feasible. The extended car park area will require general winter maintenance such as snow clearance and gritting, together with ongoing maintenance of items such as lighting, signing and lining. Where appropriate, CCTV will require to be maintained in proper working order.					
Financial:	Option would be funded through a combination of local include the Scottish Stations Fund). There are no subs		rnment funding (potentially to			
	Some consultees suggested that increased parking pro congestion issues around Lenzie station. Additional par	vision at Lenzie would attract more traffic into the are				
Public:	<u>Sub-Option - Surface access:</u> :The potential reduction o not supported.	f recreational green space associated with extending	parking at the surface level was			
<u>Sub-Option - Creating a car park on a deck over Lenzie Rail station</u> : Highly visible structure, particularly if bridges the track. Adja designated area (Townscape Protection Area). Unlikely to gain public acceptance. Strong opposition to the decking Optic consultations, as it was felt it would generate a negative visual impact.						
Environment						
Mitigation Options Included: (Costs & Benefits)	Mitigation approaches outlined in SEA.					
Sub-criterion	Qualitative Information	Quantitative Information	Significance of Impact			
Noise and Vibration	Impacts from noise and vibration disturbance are likely to be negative over the long-term duration of the intervention, predominantly due to the number and proximity of surrounding noise sensitive residential areas. Although the increased provision of car parking will draw a greater number of vehicles to the location of the rail station, it will deter rail patrons from using the surrounding residential streets for parking as an	Increased noise and vibration levels are subject to volumes of transport predicted to use the scheme, and its location in respect of noise sensitive receptors. Developing on top of the existing facilities may increase noise levels due to the higher elevation. Developing on ground adjacent to the existing facilities will likely bring areas of noise generation	Moderate Negative			
	alternative.	closer to the surrounding noise sensitive receptors.				

			· · · · · · · · · · · · · · · · · · ·
Local Air Quality – $PM_{10}$ and $NO_2$	Extending existing parking provision may have a potential detrimental impact in the locality by encouraging more cars to use the facility, especially with concentrated vehicle flows at peak access and egrees time precised.	Short-term effects are likely to occur during the construction of this Option, particularly with sensitive residential areas surrounding the rail station location. Long-term effects on air quality are predicted to be neutral, although it may increase rail patronage as	Neutral
	egress time periods.	a result of increased accessibility. Impact on air quality is dependent upon the projected shift in mode of transport.	
	Impacts will likely relate to pollutants and potential	Temporary effects on the water environment during the enlargement of the car park at Lenzie Rail Station would potentially introduce a number of pollutants and contaminants which may impact on water resources that support the Lenzie Moss immediately adjacent to the site.	
Water Quality, Drainage and Flood Defence	contaminants entering watercourses via surface water runoff during construction activities. Fuels and oils leaked from parked cars during operation may also enter water bodies, reducing water quality. Hardstanding areas may increase flood risk to surrounding areas from reducing infiltration rates and increasing run-off rates.	Permanent effects may also include the introduction of pollutants such as oils and fuels from parked vehicles to this area via the drainage system incorporated within the car park design. Although not monitored, the water resources within this area would deteriorate in quality. These impacts can be mitigated from the incorporation of appropriate SUDS measures within the drainage design, such as oil interceptors.	Minor Negative
		Secondary impacts on the ecology of the Lenzie Moss site are assessed within the Biodiversity and Habitats section.	
Geology	Ground investigation / earthworks create potential for ground contamination and / or creation of pollution leakages.	There are no sensitive geological receptors within the study area; any impacts on geological resources are not likely to be significant.	Minor negative
Biodiversity	Impacts on the habitat areas are dependent upon the final location of additional car parking provisions. Should additional land-take be required this would require tree removal from the Lenzie Mass LNP, and	The extent of impacts from the development of this Option is dependent upon the choice of location of the additional car parking spaces, and its associated land-take.	Minor Negative
	require tree removal from the Lenzie Moss LNR, and associated disturbance of any species in use of this area. Construction lighting may also temporarily disturb bats within the surrounding area.	To the immediate west of the current rail station to the north of the track is the Lenzie Moss LNR. To accommodate additional car parking that does not lie over either of the existing car parks would likely

	National Economic Impacts		here will be small employment gains in the wider study area including Glasgow, N/A ishopbriggs, Lenzie and Kirkintilloch.		
	Distributional Impacts	flexi	proposal will contribute at the National level to improv bility and movement, and thus availability, particularly opbriggs and the Kirkintilloch area.	N/A	
Integration					
Sub-criterion	Item		Qualitative Information		Quantitative Information
Transport Interchanges	Services & Ticketing		Option will encourage modal shift from car to rail, thus improving the level of integration between these modes for longer journeys. However, this may be negated by an increase in more local car trips to the rail station and this would require to be considered appropriately at the design stage. This Option involves no changes to existing rail service provision or existing ticketing arrangements.		Neutral impact
	Infrastructure & Information		Option involves increased parking provision which would be designed with consideration given to quality of infrastructure, layout and information provision.		Minor positive impact
Land-use Transport Integration			Through enhanced access to the rail network, this Option is expected to have a minor positive impact on land-use integration through improved access to land uses in the wider area. This accords with SPP 2014 and the EDC Local Plan 2.		Minor positive impact

Policy Integration	y Integration		Option aligns with SPT RTS. Encourages modal shift for longer journeys and will assist in achieving a healthy, prosperous and inclusive society. Efficient transport connections and improving access to education and employment aligns with economic policies e.g. SPP 2014 and the Scottish Government Economic Strategy. The use of public transport (as opposed to cars) for longer journeys will reduce the adverse environmental impacts of traffic, particularly harmful emissions, with an overall positive effect on health, aligning with the EDC Joint Health Improvement Plan and Climate Change Act 2008, albeit this impact may be negated at a more local level if there is an increase in car trips to the station. Does not fit well with policies to promote social inclusion, as Option does not enable the socially deprived (particularly those with no access to a car) access to the public transport network.		Minor positive impact
Accessibility & Social Inclus					
Sub-criterion	Item		Qualitative Information		Quantitative Information
Community Accessibility	Coverage		The number of people able to access local and city centre employment opportunities will increase, given the speed and capacity characteristics of rail versus other modes. This could lead to increased demand for rail, however there are no changes to PT network coverage associated with this Option.		Neutral impact
Access to Other Local Services			Cycle provision and consideration to access routes for pedestrians and cyclists will form a key element of this Option. However, the impact of increased levels of traffic on local roads may negate any accessibility benefits to pedestrians and cyclists.		Neutral impact
Comparative Accessibility Distribution/Spatial Impacts by Social Group Distribution/Spatial Impacts by Area			Anticipated to bring a slight increase in access to rail services to those who own a car only; therefore, this Option is expected have an overall neutral impact.		Neutral impact
			Would bring a slight increase in access to rail services for those who own a car, but is unlikely to provide improved access to development and regeneration sites.		Neutral impact

(Also provide name of any subsidiary organisations also involved in promoting the proposal)		Broomhill Industrial Estate, Kilsyth Road, Kirkintilloch, G66 1TF				
Proposal Name:	Develop a New Rail Station at Woodilee (with Park & Ride)	Name of Planner:	AECOM, 225 Bath Street, Glasgow G2 4GZ			
	This option involves the development of a new	Total Public Sector Funding Requirement:	Capital costs/grant (undiscounted): £7,586,200			
Proposal Description:	rail station at Woodilee with Park & Ride provision. Option assumes provision of a 50 space car park.		Annual revenue support: £225,000 p/a - £70,000 p/a			
			Present Value of Cost to Govt: £8,810,000 - £6,339,000 <sup>1</sup>			
Funding Sought From: (if applicable)	Not yet known	Amount of Application:	Not yet known			
Background Information						
Geographic Context:	Geographic Context: East Dunbartonshire is located to the north of the city area of Glasgow and covers an area of approximately 17,000ha. The study area for this commission is the Kirkintilloch/Lenzie-Bishopbriggs-Glasgow corridor, with key transport infrastructure within the area comprising Bishopbriggs and Lenzie rail stations, National Cycle Routes 754, the A803, A806 and Bishopbriggs Relief Road. The area is home to over 50,000 people and comprises a mix of commuter towns and villages from larger settlements such as Bishopbriggs and Kirkintilloch to smaller villages such as Milton of Campsie and Lennoxtown at the foot of the Campsie Hills.					
Social Context:	The main settlements in the study area are Bishopbriggs (23,118), Kirkintilloch (20,281) and Lenzie (8,873). In terms of employment, 80.3% of East Dunbartonshire's population was economically active during 2013, with 77.2% in employment. With an average weekly wage of £594.10 (as of 2013), East Dunbartonshire is one of the most affluent communities in Scotland, with wages being significantly higher than the Scottish (£508.00) and British (£518.10) national averages. East Dunbartonshire has one of the highest car ownership rates in Scotland. As a result, car usage within the study area is high and sustainable / active travel is low. Despite being a generally affluent area, the Scottish Index of Multiple Derivation (SIMD 2012)1 shows there are certain pockets in the study corridor (particularly around Kirkintilloch) where the level of deprivation is between the 20-40% National 2012 Quintiles.					
Economic Context:	The settlements of Bishopbriggs and Kirkintilloch are the economic centres of the study area. Each has significant levels of retail activity, mainly located within their town centres. In terms of key commercial developments, the most important ones are Westerhill Business Park (home to major employers such as Aviva) and Strathkelvin Retail Park (home to a large number of retail chains). The Council's Local Plan 2 also identifies major development proposals within the study area, which are either under construction or have consent granted and therefore have a high likelihood of being delivered. These include Woodilee (800+ units), Bishopbriggs East (250+ units) and Lennox Castle Hospital					

<sup>&</sup>lt;sup>1</sup> Lower PVC reflects estimated operating costs for an unmanned station with basic facilities, whereas higher PVC reflects the estimated costs with operating a manned station and additional costs.

Site (350+ units).					
Planning Objectives					
Objective:	Performance against planning objective:				
trips to key attractors outside of the study area	Moderate Positive Impact (+2): This option would improve access to the rail network, which in turn could have a moderate positive impact in terms of promoting modal shift from car to rail for strategic journeys. There may also be a degree of abstraction from other public transport modes / routes.				
	Minor Positive Impact (+1): The proposed station would open up opportunities to use rail for residents around the Woodilee area, which would see their journey times to other locations within the study area reduced if they currently access these other locations by slower, less reliable modes. However, it should be noted that the area is currently within a 10- 30 public transport (including walking) journey time of Lenzie rail station (depending on location in Woodilee).				
	Neutral / No impact (0): Woodilee is one of the major developments in the area and is expected to generate a significant travel demand when fully completed. However, a rail station may largely serve strategic journeys, as opposed to improve accessibility within the study area.				
impact on the environment.	<i>Minor Positive Impact (+1):</i> Option seeks to promote increased rail patronage, which in turn should have a positive impact in terms of achieving a degree of modal shift from the car. This could contribute to local air quality improvements as a result of reduced car emissions.				
local development, regeneration and contributes to the sustainable economic growth of the study area.	<i>Minor Positive Impact (+1):</i> A rail station would have wider economic impacts in terms of increasing the attractiveness of the area as a place to live.				
Rationale for Selection or Rejection of Proposal: Implementation of a new rail station at Woodilee performs positively against the transport planning objectives of the study. The Option support improved public transport journey times through the provision of a direct rail service from Woodilee and, in turn, strongly cont the objective of promoting modal shift for commuter journeys outside of the study area. As a result, this Option would be expected to positive contribution towards supporting local development and economic growth of the study area. However, the Option is associate number of deliverability issues.					
Implementability Appraisal	mplementability Appraisal				

Technical:	This proposal is considered to be technically feasible, with no untried technologies. There may be disruption to local traffic during construction of the new rail station and associated Park & Ride facilities, although it is to be noted that there is no clear access to a new station at Woodilee and if this option is taken forward, further investigation would be required. Constructing a station adjacent to a live railway is challenging. To achieve a new rail station there could ultimately be a need for more investment in rail infrastructure (for example to increase the capacity of the track and ensure services do not interrupt Edinburgh-Glasgow services). This may involve widening to four tracks and implementing parallel slow tracks to allow overtaking, which would result in a significant undertaking (with significant additional costs). The proposed station location should be reviewed against the infrastructure requirements of EGIP Phase 2 and consideration should be given to making the station easily modifiable for any EGIP Phase 2 requirements.					
Operational:	Resilience on rail network is a key risk to the successful operation of this option: the additional stopping times associated with new rail station at Woodilee would impact on the resilience of the rail network. The level of impact and any associated risk would require to be discussed further with Network Rail and Transport Scotland should this Option be progressed.					
Financial:	Option would likely be funded through a combination of local authority investment, SPT funding, Network Rail funding and Scottish Government funding. There is also potential for developer contributions. Scottish Planning Policy published in June 2014 states within Para 277 that "Agreement should be reached with Transport Scotland and Network Rail before rail proposals are included in a development plan or planning application and it should be noted that further technical assessment and design work will be required before any proposed new station can be confirmed as viable."					
Public:	There was general support for a rail station at Woodilee to be delivered together with a Park & Ride facility. Localised objections to Park & Ride expected depending on site selection. Stakeholder consultation suggested Lenzie residents may welcome an additional rail station at Woodilee to alleviate overspill car parking impacts from Lenzie station. Concerns were raised about rail users possibly using Woodilee station instead of the other stations in the area (i.e. Lenzie and Bishopbriggs), simply to access trains before other passengers and to be able to get a seat, thus heightening problems of overcrowding down the line. Consideration would require to be given to potential deliverability and capacity constraints associated with implementing new stations on the Edinburgh – Glasgow rail line.					
Environment						
Mitigation Options Included: (Costs & Benefits)	Mitigation approaches outlined in SEA.					
Sub-criterion	Qualitative Information	Quantitative Information	Significance of Impact			
Noise and Vibration	Potential for noise impact during construction and operation. Significant new rail or road infrastructure is likely to introduce new noise sources that may pass close to residential areas and through locations that are not currently subject to significant noise impacts. However, noise mitigation including barriers may be required in certain sections, which would lessen any impacts.	Given the close proximity of the proposed location to the Woodilee residential area, the increase of additional traffic within the area during operation will also likely increase noise and vibration during the operation of the rail station. Noise and vibration mitigation measures implemented during construction and incorporated within the final design of the scheme will aid in reducing or avoiding any significant impacts from increased noise or vibration levels. Noise and vibration effects are dependent on anticipated	Moderate Negative			

		increases of traffic volumes within the area.	
Global Air Quality – CO <sub>2</sub>	Given the scale of the study area and the level to which any modal shift will be achieved from the development of this Option, global air quality is not predicted to be significantly impacted upon.		Negligible
Local Air Quality – $PM_{10}$ and $NO_2$	There are likely to be negative effects on air quality from the construction of the rail station and associated infrastructure and access requirements. Permanent impacts are likely to result in reduced emissions and improved air quality from a modal shift to more sustainable means of transport.	The number of people / residences impacted as a result of increased pollutants and dust during construction is dependent on the scale of the station and associated Park & Ride scheme, although the receptor group will likely be predominantly those within the Woodilee development. The magnitude of beneficial effects is dependent on the level of modal shift from private vehicle usage.	Neutral – Minor Positive
Water Quality, Drainage and Flood Defence	Impacts on the water environment are dependent on the location and scale of the rail station and associated Park & Ride facility. Impacts will likely relate to pollutants and potential contaminants entering watercourses via surface water runoff during construction activities. Fuels and oils leaked from parked cars during operation may also enter water bodies, reducing water quality. Hardstanding areas may increase flood risk to surrounding areas from reducing infiltration rates and increasing runoff rates.	Impacts of the development of a rail station here are dependent upon the final location of the rail station and its associated infrastructure and access point. However it is likely that temporary effects from the increased presence of pollutants and potential contaminants will impact on the Bothlin Burn, to the immediate west of the site. The wider area surrounding the site is also subject to flood risk from surface water and from the Bothlin Burn which may be increased during earthworks and compaction of soils from site activity. Permanent impacts will likely also be as a result of increased flood extents and potential water quality deterioration of the Bothlin Burn from oils and fuels leaking from parked vehicles. It is expected that these impacts can be mitigated within the design of the scheme.	Minor Negative
Geology	Ground investigation /earthworks create potential for ground contamination, creation of pollution leakages.	There are no sensitive geological receptors within the study area; any impacts on geological resources are not likely to be significant.Breaking ground during construction may result in ground contamination.	Minor Negative
Biodiversity	To develop the rail station and Park & Ride scheme there is likely to be land-take from areas of potential	The development of a rail station at this location would require the removal of mature trees and other green	Minor Negative

	habitat value and probable tree removal to accommodate infrastructure. Subsequently habitat for protected species such as bats, breeding birds and badgers may be lost or disturbed.	space and introducing additional light sources to the area. These in turn would result in greater disturbance to protected species such as bats, badgers and breeding birds should they be in use of the area, and fragment an existing mature habitat area. There is also a pocket of Ancient Woodland listed within the AWI directly north of this site, which may be directly or indirectly impacted upon as a result of the construction and/or operation of a rail station.	
		Negative effects on local biodiversity may also result from increased pollutants within the environment during construction and decreased air quality. Impacts on the habitat areas are dependent upon the final location of the rail station, associated infrastructure and access.	
Landscape & Visual Amenity	The introduction of a new structure within the landscape has the potential to result in adverse effects on the landscape and visual amenity of the area. This structure is also likely to require lighting for health and safety and security purposes. Surrounding receptors are also likely to be impacted from lighting / light spillage. The likelihood of impacts on landscape and visual amenity will increase should natural screening such as established planting be removed.	The area to the immediate south of this site is currently being developed for housing. To accommodate the rail station there will likely be the requirement to remove some trees currently screening the railway track to the south, and there may also be wider impacts on visual amenity depending on the final scale of the scheme. The South Lenzie Conservation Area and Townscape Area and a long-distance pathway and Core Path along the Bothlin Burn are also within close proximity to this proposed location. The impacts on landscape and visual amenity from this Option are dependent on design and scale of the scheme.	Moderate Negative
Agriculture and Soils	Impacts on agriculture are likely to occur should new infrastructure result in the loss or severance agricultural land. Soils are also likely to be impacted where excavation is required, and/or earthworks for site establishment.	The area south of the rail tracks is utilised for agriculture. This land is determined to be of Class 3.2 – capable of supporting mixed agriculture. Potential impacts from land take or potential contamination of soils is dependent on the final location and scale of rail station and associated Park & Ride infrastructure.	Minor Negative
Cultural Heritage	Cultural heritage sites may be directly impacted from physical damage due to construction activities and / or vibration, or indirectly from impacts on their	The proposed site is located within close proximity to a Category B listed building. Other features within the surrounding area include an area of woodland listed	Minor Negative

	setting depending on the location, scale and design of the intervention. There is the potential that there are unknown archaeological assets located at the proposed rail station and Park & Ride location.		within the AWI and also the Lenzie Conservation Are the east. These may be either directly or indirectly affected upon during the construction and operation this Option, however the magnitude of these effects dependent upon the location and scale of the rail sta and Park & Ride facility. There remains the potential that there are unknown archaeological assets located at this location. Prior any development, an archaeological survey will be required to ensure no other assets are present that r be impacted from the development.	of is ition

Economic Activity and Location Impacts	cation Impacts Local Economic Impacts The King of the		Kirk mar jour wou acce	his Option will help to support local economic development opportunities on the irkintilloch / Lenzie – Bishopbriggs – Glasgow corridor through a combination of anaged congestion brought about by increased accessibility, and improved urney times, through the transfer of trips from road to rail. In addition, this Option ould have wider economic impacts through improving public transport and ccessibility to Glasgow, and other key economic centres located on the Edinburgh Glasgow and Stirling / Alloa – Glasgow rail line.		
National Economic Impacts			com loca opp wide	e Option will act as a fundamental 'building block' in the continuing mpetitiveness of East Dunbartonshire, and Glasgow, as strategic investment cations. There will be increased potential to gain access to new employment portunities throughout the East Dunbartonshire area, and elsewhere within the der area of Glasgow, and locations on the Glasgow – Stirling / Alloa and Glasgow Edinburgh rail line.		v N/A

	Distributional Impacts	The proposal will contribute at the National level to improving labour market flexibility and movement, and thus availability, particularly within the local study area and Glasgow, but also widening to include locations on the Glasgow – Stirling / Alloa and Glasgow - Edinburgh rail line.	N/A
Integration			
Sub-criterion	Item	Qualitative Information	Quantitative Information
Transport Interchanges	Services & Ticketing	Park & Ride facility will be provided at dedicated interchange site on the Glasgow – Stirling / Alloa and Glasgow - Edinburgh rail line. Option will encourage transfer of trips from car to rail, however this may be negated by an increase in more local car trips to the Park & Ride facility and this would require to be considered appropriately at the design stage. Due cognisance would require to be given to impact on the wider rail network, specifically the EGIP proposals, to ensure effective integration.	Minor positive impact
	Infrastructure & Information	The Park & Ride site would be designed with consideration given to quality of infrastructure, layout and information provision.	Moderate positive impact
Land-use Transport Integration		This Option is primarily aimed at residents of Kirkintilloch. It could be used specifically by those living to the east of the KLR, and would support wider development in the area. It is anticipated that this Option would have a moderate positive impact on land use integration through the provision of access to a variety of land uses in the wider area including shopping, housing, education, employment and transport. Accords with SPP 2014, the EDC Local Plan 2 and the Kirkintilloch Masterplan.	Moderate positive impact
Policy Integration		Option aligns with SPT RTS. Encourages modal shift and will assist in achieving a healthy, prosperous and inclusive society. Efficient transport connections and improving access to education and employment aligns with economic policies e.g. SPP 2014 and the Scottish Government Economic Strategy. The use of public transport (as opposed to cars) will reduce the adverse environmental impacts of traffic, particularly harmful local emissions, with an overall positive effect on health, aligning with the EDC Joint Health Improvement Plan and Climate Change Act 2008. Fits well with policies to promote social inclusion, by enabling the socially deprived (particularly those with no access to a car) access to the public transport network, and aligns with Equality Act 2010.	Minor positive impact
Accessibility & Social In	nclusion		
Sub-criterion	Item	Qualitative Information	Quantitative Information
Community Accessibility Public Transport Netv Coverage		The number of people able to access local and city centre employment opportunities will increase, given the speed and capacity characteristics of rail versus other modes. This could lead to increased demand for rail. The construction of a new rail station would increase public transport network	Moderate positive impact

			coverage and may assist in alleviating Lenzie Rail Station	parking difficulties.	
		ess to Other Local /ices	Option may promote non-motorised access to local service provision of a new rail station and Park & Ride facility. The include for cycle provision and consideration to access rou and cyclists will form a key element.	new facility should	Minor positive impact
Comparative Accessibility	Comparative Accessibility       Distribution/Spatial         Impacts by Social Group         Distribution/Spatial         Impacts by Area		Option would have a minor positive impact in terms of tackling the problem of private car use by encouraging a modal shift towards public transport and sustainable modes of travel and improving accessibility to the public transport network. Whilst this will enhance the level of accessibility for those without the use of a car, existing car users will also be encouraged to leave their cars at home in favour of other modes.		Minor positive impact
			Increases accessibility to development areas e.g. Woodilee and Kirkintilloch Masterplan area. Encourages modal shift and reduces overall reliance on the private car for commuter trips to / from Glasgow.		Moderate positive impact

Background Information					
Geographic Context:	commission is the Kirkintilloch/Lenzie-Bishopbrig Bishopbriggs and Lenzie rail stations, National Cyc	gs-Glasgow corridor, w le Routes 754, the A803 wns and villages from lar	eovers an area of approximately 17,000ha. The study area for this with key transport infrastructure within the area comprising , A806 and Bishopbriggs Relief Road. The area is home to over ger settlements such as Bishopbriggs and Kirkintilloch to smaller ie Hills.		
Social Context:	The main settlements in the study area are Bishopbriggs (23,118), Kirkintilloch (20,281) and Lenzie (8,873). In terms of employment, 80.3% of East Dunbartonshire's population was economically active during 2013, with 77.2% in employment. With an average weekly wage of £594.10 (as of 2013), East Dunbartonshire is one of the most affluent communities in Scotland, with wages being significantly higher than the Scottish (£508.00) and British (£518.10) national averages. East Dunbartonshire has one of the highest car ownership rates in Scotland. As a result, car usage within the study area is high and sustainable / active travel is low. Despite being a generally affluent area, the Scottish Index of Multiple Derivation (SIMD 2012)1 shows there are certain pockets in the study corridor (particularly around Kirkintilloch) where the level of deprivation is between the 20-40% National 2012 Quintiles.				
Economic Context:	The settlements of Bishopbriggs and Kirkintilloch are the economic centres of the study area. Each has significant levels of retail activity, mainly located within their town centres. In terms of key commercial developments, the most important ones are Westerhill Business Park (home to major employers such as Aviva) and Strathkelvin Retail Park (home to a large number of retail chains). The Council's Local Plan 2 also identifies major development proposals within the study area, which are either under construction or have consent granted and therefore have a high likelihood of being delivered. These include Woodilee (800+ units), Bishopbriggs East (250+ units) and Lennox Castle Hospital Site (350+ units).				

<sup>&</sup>lt;sup>1</sup> Lower PVC reflects estimated operating costs for an unmanned station with basic facilities, whereas higher PVC reflects the estimated costs with operating a manned station and additional costs.

Plan	nning Objectives			
Obje	ective:		Performance against planning objective:	
	<ol> <li>Promote modal shift to sustainable transport modes for trips to key attractors outside of the study area, particularly commuting journeys.</li> <li>Improve public transport journey times and journey time reliability through the study area.</li> <li>Improve accessibility by sustainable transport modes to key trip attractors within the study area.</li> <li>Deliver a transport network that supports improvements to human health and air quality, while minimising the impact on the environment.</li> <li>Provide a sustainable transport network that supports local development, regeneration and contributes to the sustainable economic growth of the study area.</li> </ol>		Moderate Positive Impact (+2): This option would improve access to the rail network, which in turn could have a moderate positive impact in terms of promoting modal shift from car to rail for strategic journeys. There may also be a degree of abstraction from other public transport modes / routes.	
			<i>Minor Positive Impact (+1):</i> The proposed station would open up opportunities to use rail for residents around the Westerhill are which would see their journey times to other locations within the study area reduced if they curren access these other locations by slower, less reliable modes. However, it should be noted that the area currently within a 10-25 public transport (including walking) journey time of Bishopbriggs town centre, a 30-40 minute journey time from Glasgow City Centre, due to the strong rail and bus network wh already exists.	
			<i>Minor Positive Impact (+1):</i> Westerhill is one of the major developments in the area and is promoted for its economic use and development, and could potentially generate a significant travel demand in the future2. It is therefore a key trip attractor within the study area, and any public transport enhancement will improve accessibility to it. However, a rail station may largely serve strategic journeys, as opposed to improve accessibility within the study area.	
			Minor Positive Impact (+1): Option seeks to promote increased rail patronage, which in turn should have a positive impact in terms of achieving a degree of modal shift from the car. This could contribute to local air quality improvements as a result of reduced car emissions.	
			Moderate Positive Impact (+2): This option would make a positive contribution towards the economic development of the study area, by better connecting key trip generators (i.e. Westerhill) to the public transport network, which would reduce commuting times and potentially attract new businesses into the study area.	
	onale for Selection or be expected be expected be	ed to positively contrib	Westerhill would encourage modal shift to rail for commuter journeys outside of the study area, and would ute to objectives around increasing accessibility to key trip attractors within the study area and supporting c growth of the study area by improving access by rail to Westerhill Business Park. However, the Option is rerability issues.	
Impl	lementability Appraisal			

Technical:	This proposal is considered to be technically feasible, with no untried technologies. There may be disruption to local traffic during construction of the new rail station and associated Park & Ride facilities. Constructing a station adjacent to a live railway is challenging. To achieve a new rail station there could ultimately be a need for more investment in rail infrastructure (for example to increase the capacity of the track and ensure services do not interrupt Edinburgh-Glasgow services). The proposed station location should be reviewed against the infrastructure requirements of EGIP Phase 2 and consideration should be given to making the stations easily modifiable for any EGIP Phase 2 requirements.						
Operational: Financial:	Resilience on rail network is a key risk to the successful operation of this option: the additional stopping times associated with new rail station at Woodilee would impact on the resilience of the rail network. The level of impact and any associated risk would require to be discussed further with Network Rail and Transport Scotland should this Option be progressed. Option would likely be funded through a combination of local authority investment, SPT funding, Network Rail funding and Scottish Government funding. There is also potential for developer contributions. Scottish Planning Policy published in June 2014 states within Para 277 that "Agreement should be reached with Transport Scotland and Network Rail before rail proposals are included in a development plan or planning application and it should be noted that further technical assessment and design work will be required before any proposed new station can be confirmed as viable."						
Public:	expected depending on site selection. Generally co established in the area, and increased accessibility generating economic development in the area, wh problems in Bishopbriggs town centre, thereby hav	be delivered together with a Park & Ride facility. Loc considered that providing a rail station at Westerhill we provided by the station would possibly attract other h hich would be publically acceptable. A station in this ring a positive impact on air quality, thus gaining pub capacity constraints associated with implementing n	ould be attractive for businesses businesses to the Westerhill site, blocation could alleviate parking lic support. Consideration would				
Environment							
Mitigation Options Included: (Costs & Benefits)	Mitigation approaches outlined in SEA.						
Sub-criterion	Qualitative Information	Quantitative Information	Significance of Impact				
	Potential for noise impact during construction and operation. Significant new infrastructure is likely to introduce new noise sources that may pass close	Increased noise and vibration disturbance will primarily impact the residential areas within Bishopbriggs East and Westerhill Business Park, to the west of the proposed station location. Levels of					
Noise and Vibration	to residential areas and through locations that are not currently subject to significant noise impacts. However, noise mitigation including barriers may be required in certain sections, which would lessen any impacts.	potential noise and vibration increase is dependent upon increased volumes of traffic at this area. Noise and vibration mitigation measures implemented during construction and incorporated within the final design of the scheme will aid in reducing or avoiding any potentially significant impacts from increased noise or vibration levels.	Moderate Negative				

	which any modal shift will be achieved from the development of this Option, global air quality is not predicted to be significantly impacted upon.		
Local Air Quality – $PM_{10}$ and $NO_2$	There are likely to be negative effects on air quality from the construction of the rail station and associated infrastructure and access requirements. Permanent impacts will also result in reduced air emissions and improved air quality from a modal shift to a more sustainable means of transport.	The overall significance of increased emissions on air quality is dependent upon the scale of the scheme and the mitigation measures that can be put in place to reduce or avoid these effects. The magnitude of beneficial effects is dependent on the level of modal shift from private vehicle usage during operation of the scheme.	Neutral - Minor Positive
Water Quality, Drainage and Flood Defence	Impacts on the water environment are dependent on the location and scale of the new rail station. Impacts will likely relate to pollutants and potential contaminants entering watercourses via surface water runoff during construction activities. Fuels and oils leaked from parked cars during operation may also enter water bodies, reducing water quality. Hardstanding areas may increase flood risk to surrounding areas from reducing infiltration rates and increasing runoff rates.	Water resources within the surrounding area of the proposed rail station are limited to small field drains and areas of surface water as a result of poor drainage. Although these water bodies may be part of the wider River Kelvin catchment, temporary effects during construction are not likely to be significant. The area to the south of the railway track is noted as being at risk to surface water flooding. The development of hardstanding area within the near vicinity may either displace or contribute to this area of flood risk. If so, a detailed flood risk assessment would be required. These impacts can be mitigated within the design of the scheme.	
Geology	Ground investigation / earthworks create potential for ground contamination and / or creation of pollution leakages.	There are no sensitive geological receptors within the study area; any impacts on geological resources are not likely to be significant.	Minor negative
Biodiversity	To develop the rail station and Park & Ride scheme there is likely to be land-take from areas of potential habitat value and probable tree removal to accommodate infrastructure. Subsequently habitat for protected species such as bats, breeding birds and badgers may be lost or disturbed.	The track is lined to the north and south by mature and young trees. The railway line is identified as an important ecological corridor by East Dunbartonshire Council. The magnitude of effect on this area is subject to the design of the scheme and the land-take required to accommodate the footprint of the rail station, associated infrastructure and access routes. The woodland habitat and surrounding fields provide good foraging and potential roosting habitat for bats, and potentially other protected species such as badgers. Breeding birds may also	Minor Negative

			be impacted should works be undertaken withi breeding season.	in the
Landscape & Visual Amenity	The introduction of a new structure within the landscape has the potential to result in adverse effects on the landscape and visual amenity of the area. This structure is also likely to require lighting for health and safety and security purposes. Surrounding receptors are also likely to be impacted from lighting / light spillage. The likelihood of impacts on landscape and visual amenity will increase should natural screening such as established planting be removed.		Development of a rail station and Park & Ride this location could result in the loss of agricultu land, and potentially some woodland areas. T may be effects on visual amenity however thes are dependent on the location and design of th scheme. Given the development of Westerhill Business Park and the BRR to the west of this location, the new station would be mostly in keeping with the surrounding area. It is predicted that other potentially adverse vie of the development could be screened.	ural Fhere se he I Minor Negative S
Agriculture and Soils	Impacts on agriculture are likely to occur should new infrastructure result in the loss or severance of agricultural land. Soils are also likely to be impacted where excavation is required, and/or earthworks for site establishment.		The area south of the rail tracks is utilised for agriculture. This land is determined to be of C 3.2 – capable of supporting 'mixed agriculture' Potential impacts from land-take or potential contamination of soils is dependent on the fina location and scale of rail station and associated Park & Ride infrastructure.	'. Minor Negative al
Cultural Heritage	Cultural heritage sites may be directly impacted from physical damage due to construction activities and / or vibration, or indirectly from impacts on their setting depending on the location, scale and design of the intervention. There is the potential that there are unknown archaeological assets located at the proposed station location.		The only known cultural heritage asset within t near vicinity of the proposed site is the Catego listed building at Cadder Yard. The impact on t building is dependent upon the final location ar design of the Option. There remains the potential that there are unkn archaeological assets located at this location. I to any development, an archaeological survey be required to ensure no other assets are press that may be impacted from the development.	ory C this and Minor Negative Prior v will

	Infras	structure & Information		ark & Ride site would be designed with consideration given to quality of tructure, layout and information provision.	Moderate positive impact
Land-use Transport Integration	n We loc rai the exp Gla de em Op		Weste locate rail ne the win expec Glasg develo emplo Optior	station at Westerhill would encourage more sustainable travel to the erhill Business Park, a growing economic centre. The rail station would be d adjacent to the BRR which would better enable car users to access the twork, thus having a moderate positive impact on access to land uses in der area including education, employment and shopping. This option is ted to have a moderate positive impact on commuting trips to / from ow, particularly for residents from Bishopbriggs (including proposed opments such as Bishopbriggs East), as well as employees from large typers such as Aviva and HarperCollins (both located in Westerhill). This is may also encourage sustainable travel for staff and visitors to the H.M. Moss Prison. Accords with SPP 2014, and the EDC Local Plan 2.	
Policy Integration			a heal improv e.g. S public enviro overal Plan a inclusi	n aligns with SPT RTS. Encourages modal shift and will assist in achievin thy, prosperous and inclusive society. Efficient transport connections and ving access to education and employment aligns with economic policies PP 2014 and the Scottish Government Economic Strategy. The use of transport (as opposed to cars) for longer journeys will reduce the advers inmental impacts of traffic, particularly harmful local emissions, with an Il positive effect on health, aligning with the EDC Joint Health Improveme and Climate Change Act 2008. Fits well with policies to promote social ion, by enabling the socially deprived (particularly those with no access to ccess to the public transport network, and aligns with Equality Act 2010.	e Minor positive impact
Accessibility & Social Inc	clusion	ı			
Sub-criterion		Item		Qualitative Information	Quantitative Information
Community Accessibility		Public Transport Netwo Coverage	ork	The number of people able to access local and city centre employment opportunities will increase, given the speed and capacity characteristics of rail versus other modes. This could lead to increased demand for rail. The construction of a new rail station would increase public transport network coverage and potentially remove pressure from the A803 corridor through Bishopbriggs by encouraging car-rail interchange at Westerhill.	Moderate positive impact
		Access to Other Local Services		Option may promote non-motorised access to local services through the provision of a new rail station and Park & Ride facility. No anticipated issues relating to severance for pedestrians or cyclists as a result of implementation of the Option. The new facility should include for cycle provision and consideration to access routes for pedestrians and cyclists will form a key element.	Minor positive impact

Comparative Accessibility	Distribution/Spatial Impacts by Social Group	Option would have a minor positive impact in terms of tackling the problem of private car use by encouraging a modal shift towards public transport and sustainable modes of travel and improving accessibility to the public transport network. Whilst this will enhance the level of accessibility for those without the use of a car, existing car users will also be encouraged to leave their cars at home in favour of other modes.		Minor positive impact	
	Distribution/Spatial Impacts by Area	Offers increase in PT network coverage. Increa development areas e.g. Bishopbriggs East, We modal shift and reduces overall reliance on the commuter trips to / from Glasgow.	esterhill. Encourages	Moderate positive impact

	Lower Level Policy Objective	Question to be scored		
Promote Economic Growth				
1	Promote 'competitive' inter-urban journey times.	To what extent does the intervention reduce inter-urban journey times?	Slight Positive	Neutral
	Reduce inter-urban journey time on public transport.	To what extent does the intervention reduce inter-urban journey time on public transport.	Moderate Positive	Neutral
3	Reduce the proportion of driver journeys delayed due to traffic.	To what extent does the intervention reduce the proportion of driver journeys delayed due to traffic?	Neutral	Neutral
	Maximise the labour catchment area in city regions	To what extent does the intervention help maximise the labour catchment area in city regions where economic evidence demonstrates that this is required?	Slight Positive	Slight Positive
	Support the development and implementation of relevant proposed national developments identified in the National Planning Framework	To what extent does the intervention support the development and implementation of relevant proposed national developments identified in the National Planning Framework?	Neutral	Neutral
Improve Integration				
6	Promote seamless travel	To what extent does the intervention improve the integration of journeys made by public transport or via Park and Ride by reducing interchanges and interchange times?	Slight Positive	Moderate Positive
	Policy integration	To what extent does the intervention support or constrain the potential achievement of policy objectives within other sectors or delivery agencies?	Neutral	Neutral
	Access to amenities and services	To what extent does the intervention improve accessibility?	Slight Positive	Slight Positive
Protect the environment and improve Health				
9	Reduce CO2 emissions per person	To what extent does the intervention reduce CO2 emissions per person?	Slight Positive	Slight Positive
	Meet the targets set out in the Climate Change (Scotland) Act 2010	To what extent does the intervention help meet the targets set out in the Climate Change (Scotland) Act 2010	Slight Positive	Slight Positive
11	Improve air quality	To what extent does the intervention affect air quality? Is the intervention located in an Air Quality Management Area?	Moderate Positive	Neutral
12	Improve health	To what extent does the intervention enable the population of Scotland to live longer healthier lives?	Neutral	Neutral
13	Well designed, sustainable places	To what extent does the intervention improve landscape, streetscape and the local environment?	Neutral	Neutral
14	Reduce the overall ecological footprint	To what extent does this intervention reduce overall ecological footprint?	Slight Positive	Slight Positive
Improve safety of				
journeys 15	Promote continuing reduction in accident rates and severity rates across the strategic transport network recognising the need to continue the work of the Strategic Road Safety Plan through the STPR period.	To what extent does the intervention promote continuing reduction in accident rates and severity rates across the strategic transport network?	Neutral	Neutral
16	To reduce the accident and severity rate to the national average	Does the intervention have the potential to reduce accident rates?	Slight Positive	Neutral
Promote social inclusion				
17	Improve the competitiveness of public transport relative to the car	To what extent does the intervention improve the competitiveness of public transport relative to the car?	Moderate Positive	Moderate Positive
18		To what extent does the intervention improve the choice of modes or routes facing public transport users?	Moderate Positive	Moderate Positive
19		To what extent does the intervention reduce the relative costs of public transport?	Neutral	Neutral
20	Reduce Inequality	To what extent does the intervention tackle the significant inequalities in Scottish society?	Neutral	Neutral
21	Improve overall perceptions of public transport	To what extent does the intervention Improve overall perceptions of public transport	Moderate Positive	Moderate Positive
